

CT-6373

Wireless Multi-DSL IAD

User's Manual

Version A1.0, April 14, 2007

Warning

- Before servicing or disassembling this equipment, always disconnect all power and telephone lines from the device.
- Use an appropriate power supply and a UL Listed telephone line cord. Specification of the power supply is clearly stated in Appendix D - Specifications.

Preface

This manual provides information to network administrators. It covers the installation, operation and applications of the Wireless Multi DSL Router.

The reader reading this manual is presumed to have a basic understanding of telecommunications. For product update, new product release, manual revision, software upgrade, technical support, etc., visit Comtrend Corporation at <http://www.comtrend.com>

This document is subject to change without notice.

Recycling For The Environment

Never throw your electronic equipment out with household waste. Ask for information from your town council on how to correctly dispose of it, so that it does not damage the environment. Always respect the current legislation regarding waste disposal.

Persons who do not comply are subject to the sanctions and penalties set down in law.

The cardboard box, the plastic contained in the packaging, and the parts that make up the device can be recycled in accordance with regionally established regulations.

The symbol of the container with the cross, which is found on the device means that when the equipment has reached the end of its working life, it must be taken to the recycling centres provided, and that its processing must be separate from that of domestic waste.

Chapter 1 Introduction

The CT-6373 integrates ADSL2+, VDSL2, WLAN and VoIP in one unit, which supports triple play service and supplies predictable, real-time, toll-quality voice over the Internet.

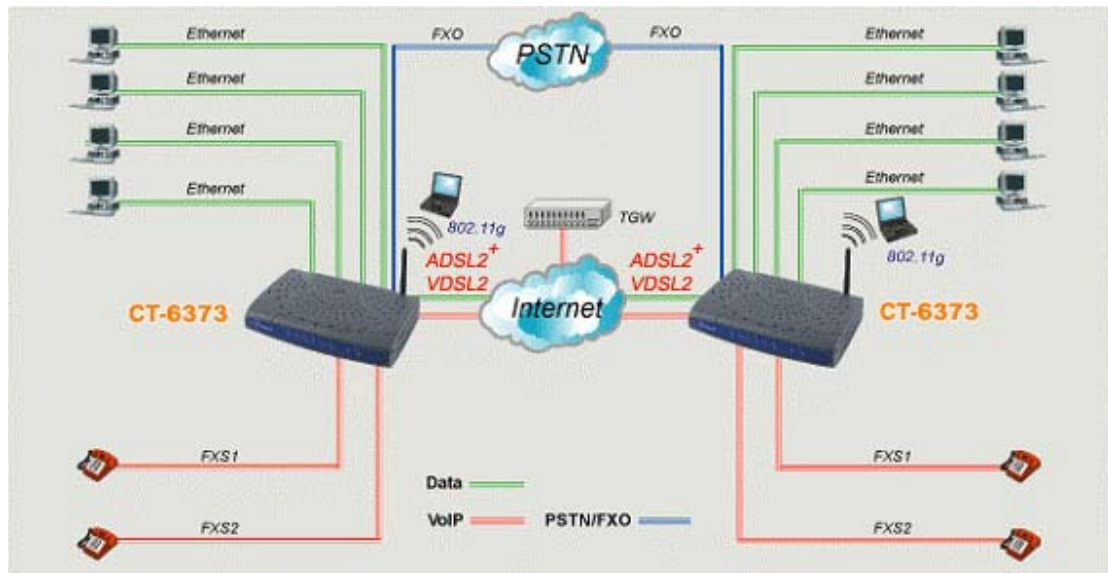

The CT-6373 contains an ADSL2+ interface, VDSL2 interface, two FXS ports for VoIP service, one FXO port for PSTN service, one 802.11b/g WLAN port, one USB 1.1 device, one USB 2.0 host and four Ethernet ports for Broadband service.

1.1 Features

- Multi-DSL VoIP and Router Integrated
- Automatically switches to ADSL2+ or VDSL2 according to the port setting of DSLAM
- Integrated 802.11g AP (backward compatible with 802.11b)
- Supports life line: PSTN alive when power off
- Supports fast emergency call
- Supports Quality of Service (QoS) for voice
- Supports caller ID presentation and restriction
- Supports call hold
- Supports call waiting
- Supports call forwarding
- Supports call transfer
- Supports 3-way conference
- Supports Direct number dialing
- Remote administration and automatic remote firmware upgrade and configuration
- Supports VPN Pass-Through
- Supports Day-time parental control

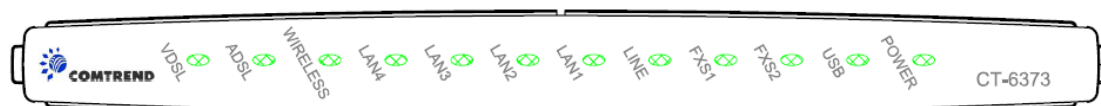

1.2 Application

The following diagram depicts the application of the CT-6373.

1.3 Front Panel LED Indicators

The front panel LEDs are shown in the picture below, followed by an explanation in the table below.

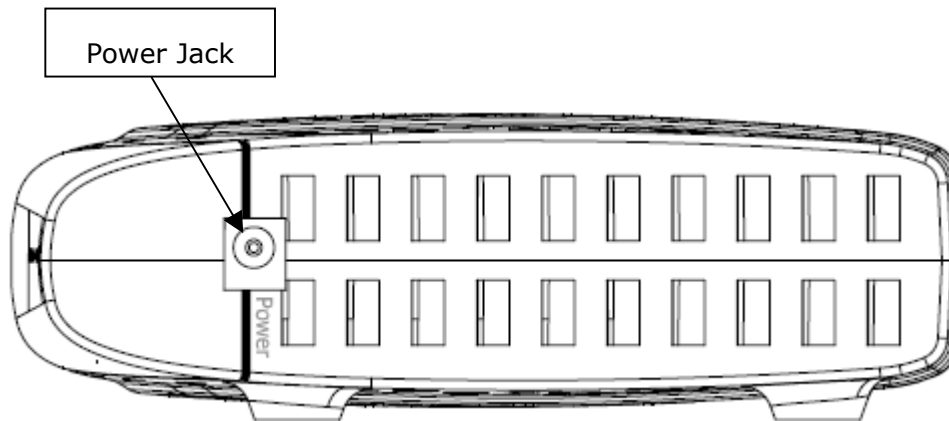

LED	Color	Mode	Description
POWER	Green	On	The Router is powered up and ADSL or VDSL link is established.
		Off	The Router is powered down.
	Orange	On	Powered up but The ADSL/VDSL link is terminated.
USB	Green	On	A USB device is connected.
		Off	A USB device is not connected.
	Green	Blink	Data transmitting or receiving over USB.
FXS 2	Green	Off	An FXS port is on hook.
		On	An FXS port is off hook.
FXS 1	Green	Off	An FXS port is on hook.
		On	An FXS port is off hook.
LAN 4x~1x	Green	On	An Ethernet Link is established.
		Off	An Ethernet Link is not established.
	Green	Blink	Data transmitting or receiving over LAN.
Line	Green	Off	An FXO port is on hook.
		On	An FXO port is off hook.
WIRELESS	Green	On	The wireless module is ready.
		Off	The wireless module is not installed.
	Green	Blink	Data transmitting or receiving over wireless.

ADSL	Green	On	The ADSL link is established.
		Off	The ADSL link is not established.
	Green	Blink	The ADSL link is training.
VDSL	Green	On	The VDSL link is established.
		Off	The VDSL link is not established.
	Green	Blink	The VDSL link is training.

1.4 Side panel

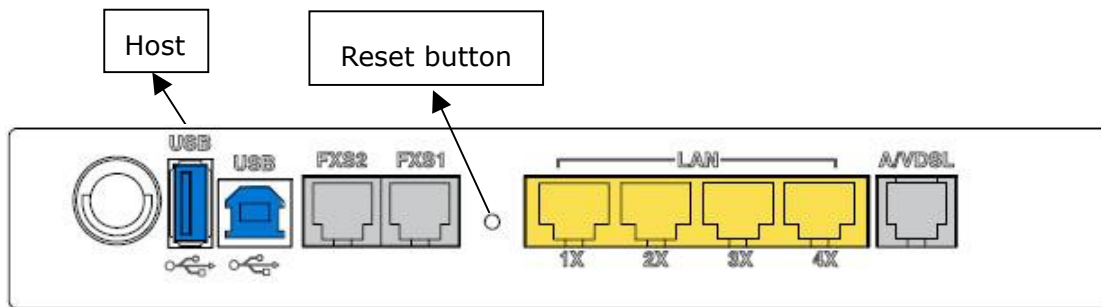

The side panel with the power Jack is shown in the picture below.

Chapter 2 Installation

2.1 Hardware Installation

In the rear panel, there is a reset button. To load the factory default settings, hold the reset button down for at least 5 seconds.

Follow the instructions below to complete the hardware connections.

Connection to LINE port

If you wish to connect both the Router and a telephone, connect the LINE port to a POTS splitter with a RJ11 connection cable.

Connection to LAN port

To connect to a hub or PC, use a RJ45 cable. You can connect the Router to up to four LAN devices. The ports are auto-sensing MDI/X and either straight-through cable or crossover cable can be used.

Connection to USB device port

Connect the USB device port to a PC with a standard USB cable.

Connection to USB host port

The CT-6373 is equipped with one high-speed USB2.0 host connection.

With software support, users can connect USB devices such as printers and a hard disc to the CT-6373. For this software release, printer server is supported.

Connection to Power

Connect the **Power** jack to the shipped power cord. Attach the power adapter to the wall outlet or other AC source.

After all connections have been made, press the power-switch in to turn the device on. After power on, the Router performs a self-test. Wait for a few seconds until the test is finished, then the Router will be ready to operate.

Caution 1: If the Router fails to power up, or it malfunctions, first verify that the power supply is connected correctly. Then power it on again. If the problem persists, contact our technical support engineers.

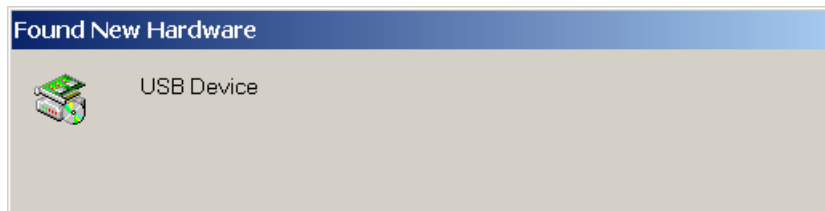

Caution 2: Before servicing or disassembling this equipment, always disconnect all power cords and telephone lines from the wall outlet.

2.2 Installing the USB Device Driver

Before you connect your Router's USB cable to your PC, you must load the ADSL USB drivers. The USB driver supports Windows 98, ME, 2000, XP and Vista.

To connect the Router to a PC using the USB interface, you need to use a standard USB cable and install the USB interface software. Follow the steps below:

STEP 1: Connect the USB Router to the PC by plugging the flat connector of a standard USB cable into your PC, and plugging the square connector into the Router. The screen will display as below:

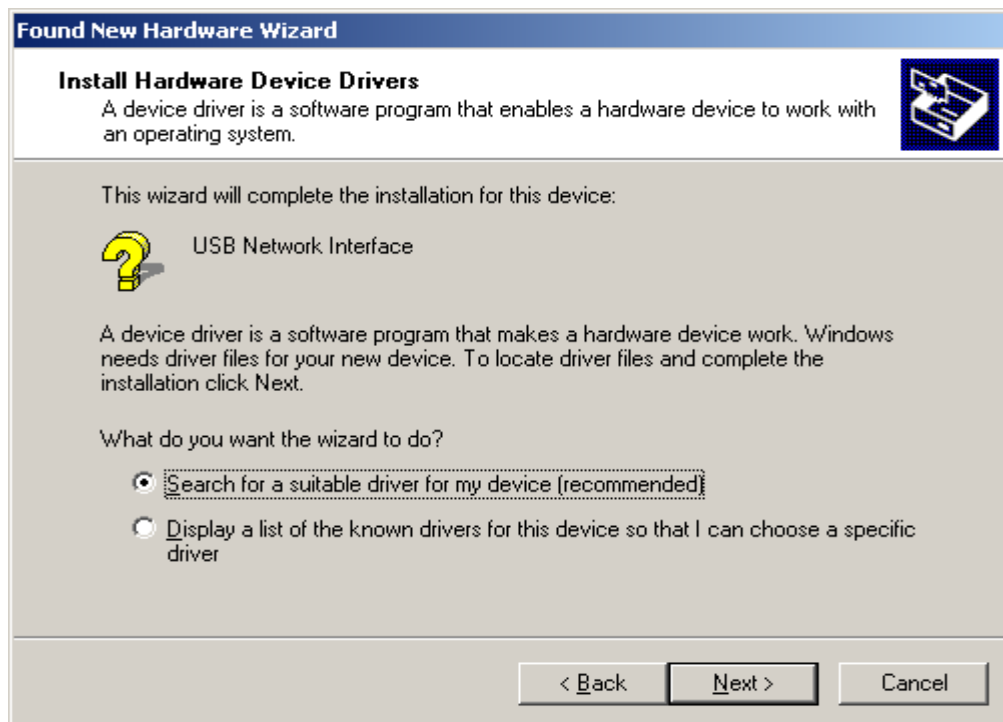

STEP 2: When the screen displays as below, click the **Next** button.

Note: This screen won't be displayed if the USB Driver has been previously un/installed.

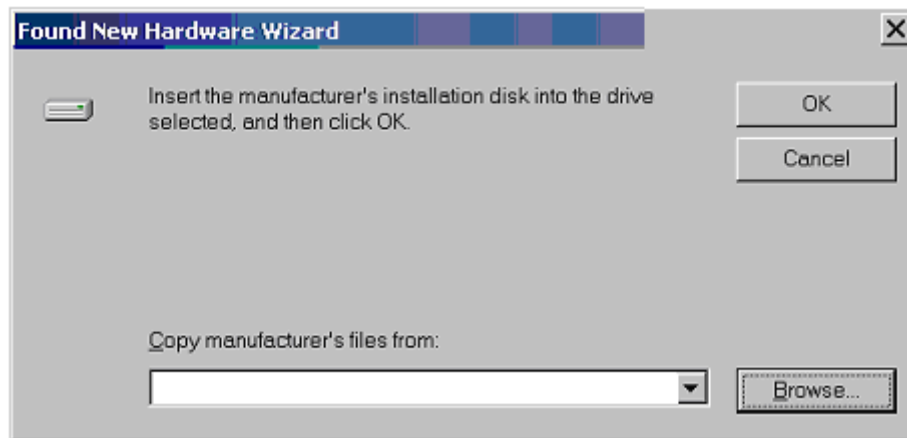

STEP 3: When the screen displays as below, select **Search for a suitable driver** and click the **Next** button.

STEP 4: Select Specify a location and click the Next button. If you are installing the software from a disk, insert the disk.

STEP 5: Select the location of the file using the **Browse** button. Normally, the file is on the CD-ROM shipped with the device.

STEP 6: Locate the file, and click the **Open** button.

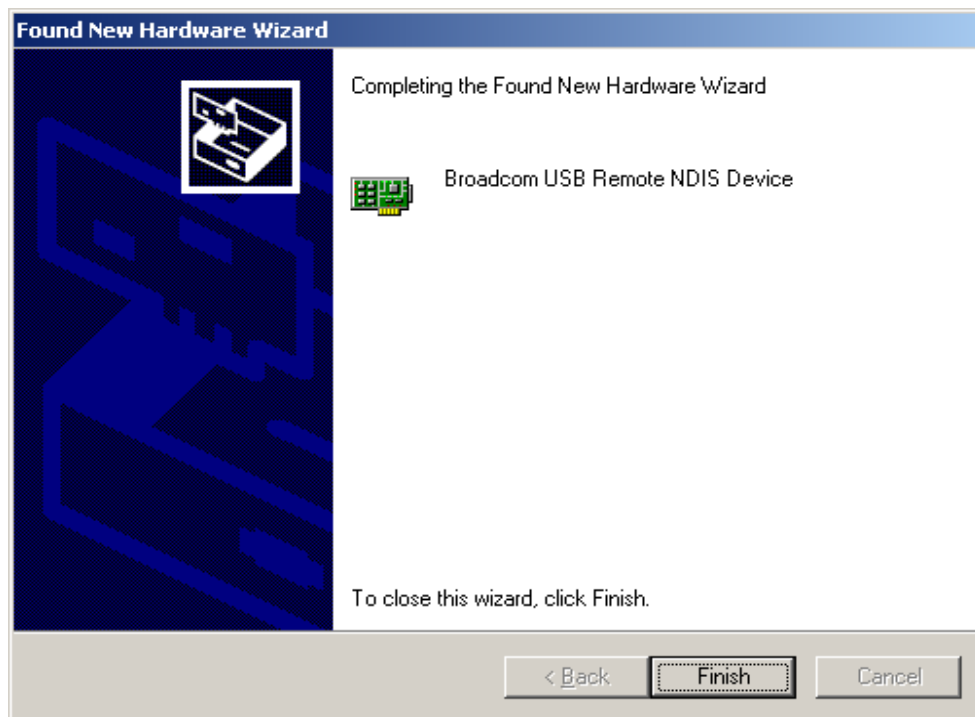

STEP 7: When the screen displays as below, click the **OK** button.

STEP 8: When the screen below displays, click the **NEXT** button.

STEP 9: Click the **Finish** button, when the screen displays as below.

STEP 10: Installation is complete.

Chapter 3 Login via the Web Browser

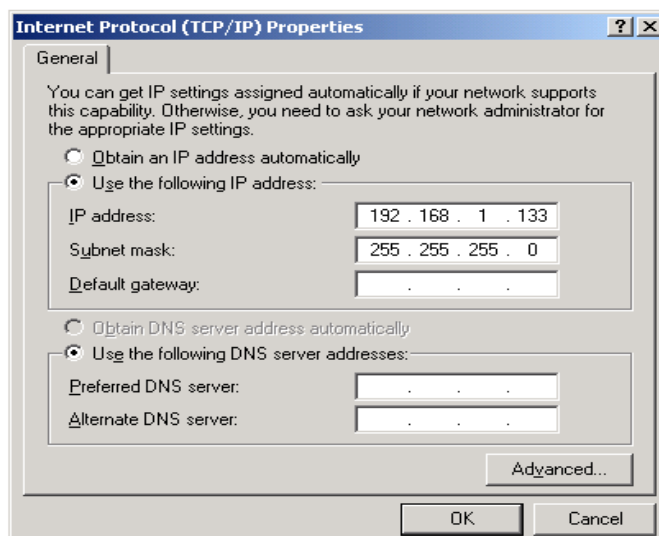

This section describes how to manage the Router via a Web browser via the remote end. You can use a web browser such as Microsoft Internet Explorer, or Netscape Navigator. (Web page is best viewed with Microsoft Internet Explorer 5.5 and later) A unique default user account is assigned with user name **root** and password **12345**. The user can change the default password later when logged in to the device.

3.1 IP Address

The default IP address of the CT-6373 (LAN port) is 192.168.1.1. To configure the CT-6373 for the first time, the configuration PC must have a static IP address within the 192.168.1.x subnet. Follow the steps below to configure your PC IP address to use subnet 192.168.1.x.

STEP 1: Right click on the Local Area Connection under the Network and Dial-Up connection window and select Properties.

STEP 2: Enter the TCP/IP screen and change the IP address to the domain of 192.168.1.x/24.

STEP 3: Click **OK** to submit the settings.

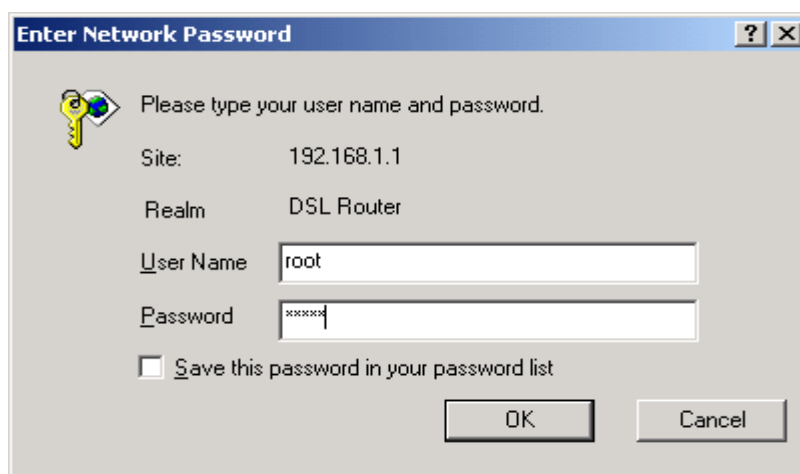

STEP 4: Start your Internet browser and type the IP address for the Router (192.168.1.1) in the Web address bar.

3.2 Login Procedure

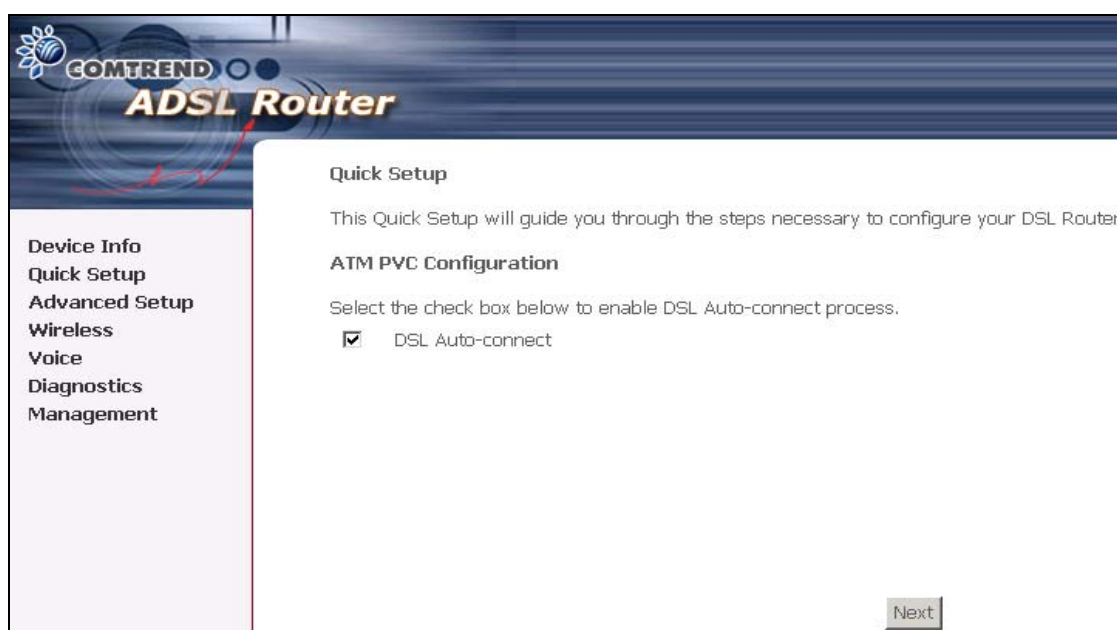

Perform the following steps to bring up the Web user interface and configure the CT-6373. To log on to the system from the Web browser, follow the steps below:

STEP 1: Start your Internet browser. Type the IP address for the Router in the Web address field. For example, if the IP address is 192.168.1.1, type **http://192.168.1.1**

STEP 2: You will be prompted to enter your user name and password. Type **root** in the user name and **12345** in the password field, and click **OK**. These values can be changed later in the Web User Interface by selecting the **Management** link.

STEP 3: After successfully logging in, you will reach the Quick Setup menu.

3.3 Default Settings

During power on initialization, the CT-6373 initializes all configuration attributes to default values. It will then read the configuration profile from the Permanent Storage section on the flash memory. The default attributes are overridden when identical attributes with different values are configured. The configuration profile in Permanent Storage can be created via the Web user interface or telnet user interface, or other management protocols. The factory default configuration can be restored either by pushing the reset button for more than five seconds, or by clicking the Restore Default Configuration option in the Restore Settings screen.

The following default settings are present when setting up the Router for the first time.

- LAN port IP address: 192.168.1.1
- Local administrator account name: root
- Local administrator account password: 12345
- Local non- administrator account name: user
- Local non- administrator account password: user
- Remote WAN access account name: support
- Remote WAN access account password: support
- DHCP server on LAN interface: enabled
- WAN IP address: none

Chapter 4 Quick Setup

After login, the **Quick Setup** screen appears as shown.

COMTREND ADSL Router

Quick Setup

This Quick Setup will guide you through the steps necessary to configure your DSL Router.

ATM PVC Configuration

Select the check box below to enable DSL Auto-connect process.

☒ DSL Auto-connect

B0 Line Rate - Upstream (Kbps):	
B0 Line Rate - Downstream (Kbps):	
B1 Traffic Type:	
B1 Line Rate - Upstream (Kbps):	
B1 Line Rate - Downstream (Kbps):	
LAN IP Address:	192.168.1.1
Default Gateway:	
Primary DNS Server:	192.168.1.1
Secondary DNS Server:	192.168.1.1

This information reflects the current status of your VoIP connection.

Phone 1 Current Status:	Direct Mode
Phone 2 Current Status:	Direct Mode

Note: The selections available on the left side of menu are based upon the configured connection.

4.1 WAN

Click **Device Info** on the menu bar to display the WAN option. Then, click **WAN** on the Device Info menu bar to display the configured PVC(s) and the status.

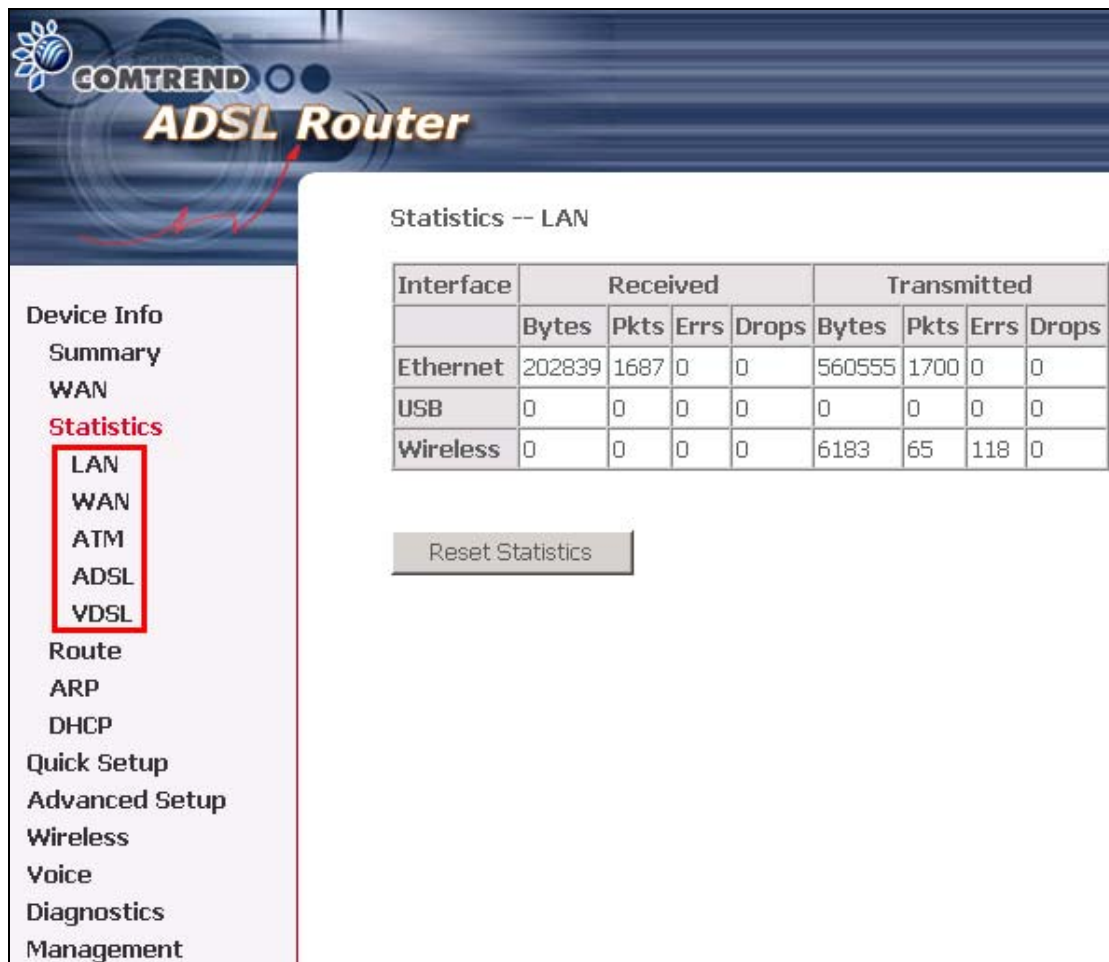

VPI/VCI	Con. ID	Category	Service	Interface	Protocol	Igmp	QoS	State	Status	IP Address
---------	---------	----------	---------	-----------	----------	------	-----	-------	--------	------------

VPI/VCI	Shows the values of the ATM VPI/VCI
Con. ID	Shows the connection ID
Category	Shows the ATM service classes
Service	Shows the name for WAN connection
Interface	Shows connection interfaces
Protocol	Shows the connection type, such as PPPoE, PPPoA, etc.
IGMP	Shows the state of the IGMP function
State	Shows the connection state of the WAN connection
Status	Lists the status of DSL link
IP Address	Shows IP address for WAN interface

4.2 Statistics

Selection of the Statistics screen provides statistics for the Network Interface of LAN, WAN, ATM, ADSL and VDSL. All statistics screens are updated every 15 seconds.

COMTREND

4.2.1 LAN Statistics

The Network Statistics screen shows the interface statistics for Ethernet, USB and Wireless interfaces. (The Network Statistics screen shows the interface statistics for the LAN interface. This provides byte transfer, packet transfer, Error and Drop statistics for the LAN interface.)

4.2.2 WAN Statistics

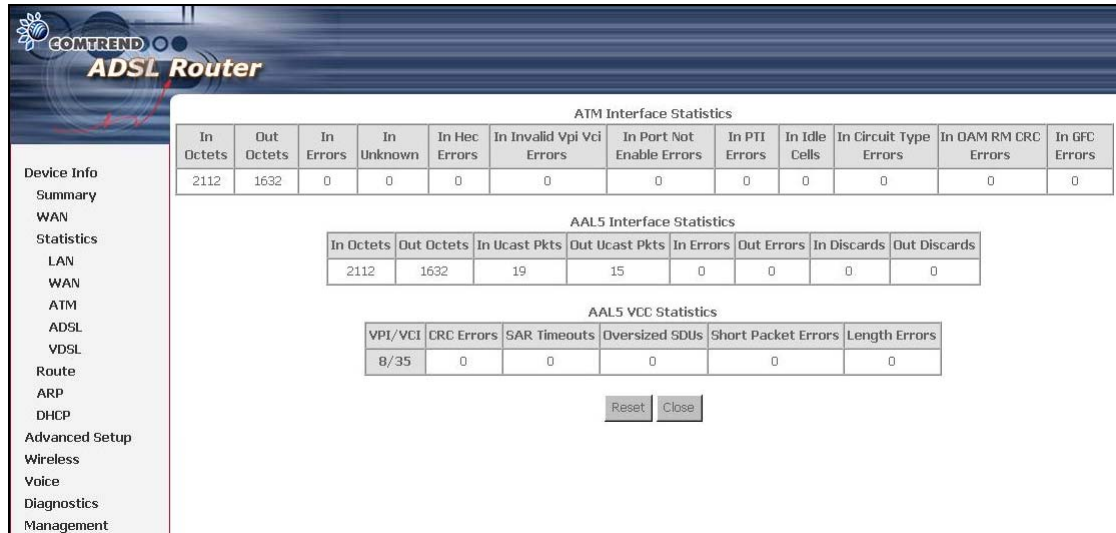

The screenshot shows the COMTREND ADSL Router web interface. On the left is a navigation menu with the following items: Device Info, Summary, WAN, Statistics, LAN, WAN (highlighted in red), ATM, ADSL, VDSL, Route, ARP, DHCP, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, and Management. The main content area is titled "Statistics -- WAN". It contains a table with the following columns: Service, VPI/VCI, Protocol, Interface, Received (sub-columns: Bytes, Pkts, Errs, Drops), and Transmitted (sub-columns: Bytes, Pkts, Errs, Drops). Below the table is a "Reset Statistics" button.

Service	Shows the service type
VPI/VCI	Shows the values of the ATM VPI/VCI
Protocol	Shows the connection type, such as PPPoE, PPPoA, etc.
Interface	Shows connection interfaces
Received/Transmitted	
- Bytes	Number of Bytes Received/Transmitted
- Pkts	Number of packets Received/Transmitted
- Errs	Number of errored packets Received/Transmitted
- Drops	Number of dropped packets Received/Transmitted

4.2.3 ATM statistics

The following figure shows the ATM statistics screen.

ATM Interface Statistics

Field	Description
In Octets	Number of received octets over the interface
Out Octets	Number of transmitted octets over the interface
In Errors	Number of cells dropped due to uncorrectable HEC errors
In Unknown	Number of received cells discarded during cell header validation, including cells with unrecognized VPI/VCI values, and cells with invalid cell header patterns. If cells with undefined PTI values are discarded, they are also counted here.
In Hec Errors	Number of cells received with an ATM Cell Header HEC error
In Invalid Vpi Vci Errors	Number of cells received with an unregistered VCC address.
In Port Not Enabled Errors	Number of cells received on a port that has not been enabled.
In PTI Errors	Number of cells received with an ATM header Payload Type Indicator (PTI) error
In Idle Cells	Number of idle cells received
In Circuit Type Errors	Number of cells received with an illegal circuit type
In OAM RM CRC Errors	Number of OAM and RM cells received with CRC errors
In GFC Errors	Number of cells received with a non-zero GFC.

ATM AAL5 Layer Statistics over ADSL interface

Field	Description
In Octets	Number of AAL5/AAL0 CPCS PDU octets received
Out Octets	Number of AAL5/AAL0 CPCS PDU octets transmitted
In Ucast Pkts	Number of received AAL5/AAL0 CPCS PDU passed to a higher-layer
Out Ucast Pkts	Number of received AAL5/AAL0 CPCS PDU received from a higher layer for transmission
In Errors	Number of received AAL5/AAL0 CPCS PDU in error. The types of errors counted include CRC-32 errors.
Out Errors	Number of received AAL5/AAL0 CPCS PDU that could be not transmitted due to errors.
In Discards	Number of received AAL5/AAL0 CPCS PDU discarded due to an input buffer overflow condition.
Out Discards	This field is not currently used

ATM AAL5 Layer Statistics for each VCC over ADSL interface

Field	Descriptions
CRC Errors	Number of PDUs received with CRC-32 errors
SAR TimeOuts	Number of partially re-assembled PDUs which were discarded because they were not fully re-assembled within the required period of time. If the re-assembly time is not supported then, this object contains a zero value.
Over Sized SDUs	Number of PDUs discarded because the corresponding SDU was too large
Short Packets Errors	Number of PDUs discarded because the PDU length was less than the size of the AAL5 trailer
Length Errors	Number of PDUs discarded because the PDU length did not match the length in the AAL5 trailer

4.2.4 ADSL Statistics

The following figure shows the ADSL Network Statistics screen. Within the ADSL Statistics window, a bit Error Rate Test can be started using the ADSL BER Test button. The Reset button resets the statistics.

4.2.6 Route

Click **Route** to display the routes that the route information has learned.

The screenshot shows the Comtrend ADSL Router web interface. The top banner features the Comtrend logo and the text "ADSL Router". On the left is a vertical navigation menu with the following items: Device Info, Summary, WAN, Statistics, Route (highlighted in red), ARP, DHCP, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, and Management. The main content area is titled "Device Info -- Route". Below the title, it provides a legend for route flags: "Flags: U - up, ! - reject, G - gateway, H - host, R - reinstate, D - dynamic (redirect), M - modified (redirect)". A table displays the learned routes with the following data:

Destination	Gateway	Subnet Mask	Flag	Metric	Service	Interface
192.168.1.0	0.0.0.0	255.255.255.0	U	0		br0

4.2.7 ARP

Click **ARP** to display the ARP information.

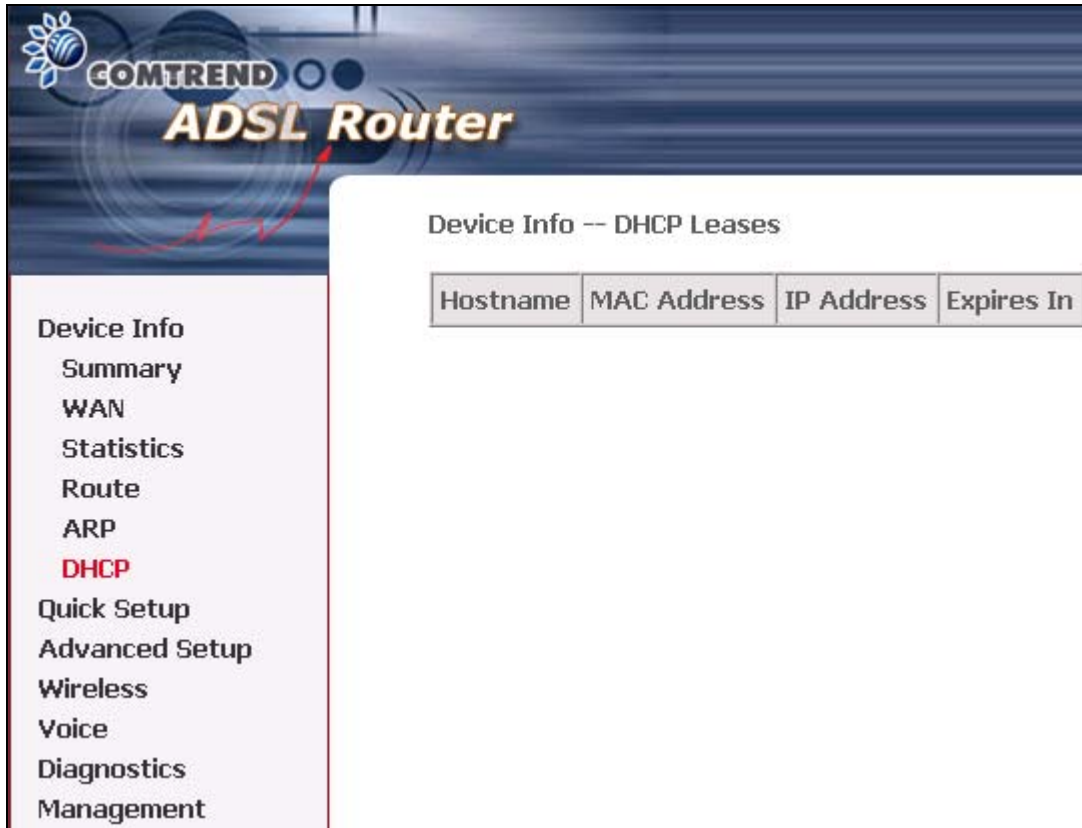

The screenshot displays the Comtrend ADSL Router web interface. The top banner features the Comtrend logo and the text "ADSL Router". On the left, a vertical menu lists various configuration options: Device Info, Summary, WAN, Statistics, Route, **ARP** (highlighted in red), DHCP, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, and Management. The main content area is titled "Device Info -- ARP" and contains a table with the following data:

IP address	Flags	HW Address	Device
192.168.1.133	Complete	00:05:5D:0C:56:E1	br0

4.2.8 DHCP

Click **DHCP** to display the DHCP Leases information.

The screenshot displays the Comtrend ADSL Router web interface. The top banner features the Comtrend logo and the text "ADSL Router". On the left, a vertical navigation menu lists various settings: Device Info, Summary, WAN, Statistics, Route, ARP, **DHCP** (highlighted in red), Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, and Management. The main content area is titled "Device Info -- DHCP Leases" and contains a table with the following headers: Hostname, MAC Address, IP Address, and Expires In. The table body is currently empty.

Hostname	MAC Address	IP Address	Expires In
----------	-------------	------------	------------

Chapter 5 Quick Setup

The Quick Setup allows the user to configure the Multi-DSL Router for DSL connectivity and Internet access. It also guides the user through the WAN network setup first and then the LAN interface setup. You can either manually customize the Router or follow the online instruction to set up the Router.

The CT-6373 Multi-DSL Router supports the following five network operating modes over an ATM PVC WAN interface.

- PPP over Ethernet (PPPoE)
- PPP over ATM (PPPoA)
- MAC Encapsulated Routing (MER)
- IP over ATM (IPoA)
- Bridging

The following configuration considerations apply:

- The WAN network operating mode operation depends on the service provider's configuration on the Central Office side and Broadband Access Server for the PVC
- If the service provider provides PPPoE service, then the connection selection depends on whether the LAN-side device (typically a PC) is running a PPPoE client or whether the CT-6373 is to run the PPPoE client. The CT-6373 can support both cases simultaneously.
- If every LAN-side device is running a PPPoE client, then select Bridge in PPPoE mode. CT-6373 also supports pass-through PPPoE sessions from the LAN side while simultaneously running a PPPoE client for non-PPPoE LAN devices.
- NAT and firewall are always enabled when PPPoE mode is selected, but they can be enabled or disabled by the user when MER or IPoA is selected, NAT and firewall are always disabled when Bridge mode is selected.
- Depending on the network operating mode, and whether NAT and firewall are enabled or disabled, the main panel will display or hide the NAT/Firewall menu. For instance, at initial setup, the default network operating mode is Bridge. The main panel will not show the NAT and Firewall menu.

Note: Up to eight PVC profiles can be configured and saved on the flash memory. To activate a particular PVC profile, you need to navigate all the Quick Setup pages until the last summary page, then click on the Finish button and reboot the system.

5.1 Auto Quick Setup

The auto quick setup requires the DSL link to be up. The Multi-DSL Router will automatically detect the PVC. You only need to follow the online instructions that you are prompted with.

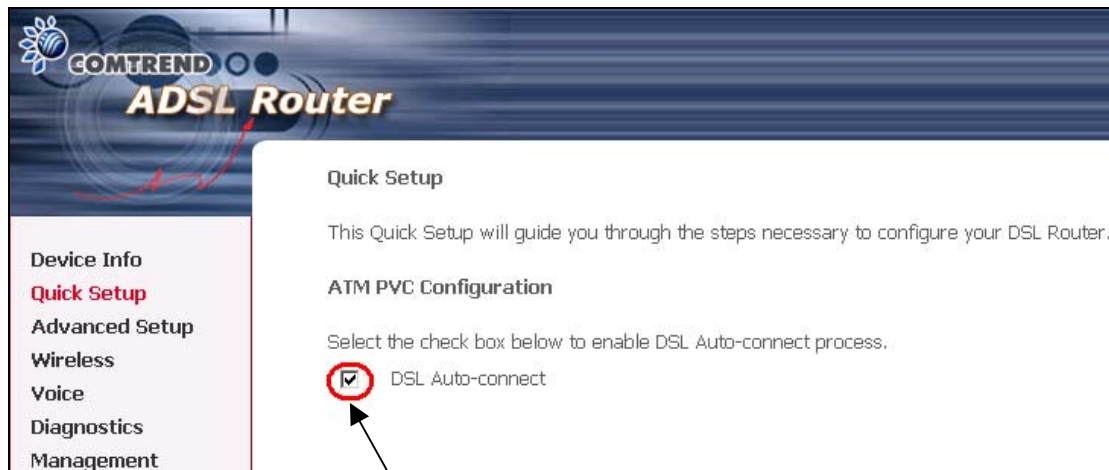

1. Select **Quick Setup** to display the DSL Quick Setup screen.

2. Click **Next** to start the setup process. Follow the online instructions to complete the setting. This procedure will skip some processes like PVC index, or encapsulation.
3. After the settings are complete, you can use the ADSL service.

5.2 Manual Quick Setup

STEP 1: Click **Quick Setup** and un-tick the **DSL Auto-connect** checkbox to enable manual configuration of the connection type.

COMTREND
ADSL Router

Device Info
Quick Setup
Advanced Setup

Management

Quick Setup

This Quick Setup will guide you through the steps necessary to configure your DSL Router.

ATM PVC Configuration

Select the check box below to enable DSL Auto-connect process.

☒ DSL Auto-connect

Un-tick this checkbox to enable manual setup and display the following screen.

The Virtual Path Identifier (VPI) and Virtual Channel Identifier (VCI) are needed for setting up the ATM PVC. Do not change VPI and VCI numbers unless your ISP instructs you otherwise.

VPI: [0-255]

VCI: [32-65535]

Enable Quality Of Service

Enabling QoS for a PVC improves performance for selected classes of applications. However, since QoS also consumes system resources, the number of PVCs will be reduced consequently. Use **Advanced Setup/Quality of Service** to assign priorities for the applications.

Enable Quality Of Service ☐

Next

STEP 2: Enter the Virtual Path Identifier (VPI) and Virtual Channel Identifier (VCI). Select Enable Quality Of Service if required. Click **Next**.

STEP 3: Then, choose the Encapsulation mode. Select **Enable 802.1q** (by ticking the box) if required, and input a number for the VLAN ID. Click Next.

VLAN ID[0-4095]:

Back Next

Encapsulation Mode

Choosing different connection types provides different encapsulation modes.

- PPPoA- VC/MUX, LLC/ENCAPSULATION
- PPPoE- LLC/SNAP BRIDGING, VC/MUX
- MER- LLC/SNAP-BRIDGING, VC/MUX
- IPoA- LLC/SNAP-ROUTING, VC MUX
- Bridging- LLC/SNAP-BRIDGING, VC/MUX

STEP 4: Click **Next** to display the following screen. Choosing different connection types pops up different settings requests. Enter appropriate settings that are requested by your service provider. The following descriptions state each connection type setup separately.

5.2.1 PPP over ATM (PPPoA) and PPP over Ethernet (PPPoE)

1. Select the **PPP over ATM (PPPoA)** or **PPP over Ethernet (PPPoE)** radio button and click **Next**. The following screen appears:

The screenshot shows the 'PPP Username and Password' configuration page of a COMTREND ADSL Router. The page has a blue header with the COMTREND logo and 'ADSL Router' text. On the left is a navigation menu with options: Device Info, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, and Management. The main content area is titled 'PPP Username and Password' and includes a descriptive paragraph: 'PPP usually requires that you have a user name and password to establish your connection. In the boxes below, enter the user name and password that your ISP has provided to you.' Below this are four input fields: 'PPP Username:', 'PPP Password:', 'PPPoE Service Name:', and 'Authentication Method:' (a dropdown menu currently set to 'AUTO'). There are four checkboxes: 'Dial on demand (with idle timeout timer)', 'PPP IP extension', 'Use Static IP Address', and 'Enable PPP Debug Mode'. At the bottom right are 'Back' and 'Next' buttons.

PPP Username/PPP Password

Give "PPP Username" and "PPP Password", then select the "Authentication Method" (AUTO/PAP/CHAP/MSCHAP). Please contact your ISP for the information. The WEB user interface allows a maximum of 256 characters in the PPP user name and a maximum of 32 characters in PPP password.

PPPoE service name

For PPPoE service, PADI requests contain a service name-tag. Some PPPoE servers (or BRAS) of ISP check this service name-tag for connection.

Disconnect if no activity

The CT-6373 can be configured to disconnect if there is no activity for a period of time by selecting the **Dial on demand** check box. When the checkbox is ticked, you need to enter the inactivity timeout period. The timeout period ranges from 1 minute to 4320 minutes. The default is 0 minutes.

This is a close-up of the 'Dial on demand (with idle timeout timer)' checkbox, which is checked. Below it is the 'Inactivity Timeout (minutes) [1-4320]:' label followed by a text input field containing the value '0'.

PPP IP Extension

The PPP IP Extension is a special feature deployed by some service providers.

Unless your service provider specially requires this setup, do not select it.

The PPP IP Extension supports the following conditions:

- Allows only one PC on the LAN
- The public IP address assigned by the remote side using the PPP/IPCP protocol is actually not used on the WAN PPP interface. Instead, it is forwarded to the PC's LAN interface through DHCP. Only one PC on the LAN can be connected to the remote, since the DHCP server within the Multi-DSL Router has a single IP address to assign to a LAN device.
- NAT and firewall are disabled when this option is selected.
- The Multi-DSL Router becomes the default gateway and DNS server to the PC through DHCP using the LAN interface IP address.
- The Multi-DSL Router extends the IP subnet at the remote service provider to the LAN PC. That is, the PC becomes a host belonging to the same IP subnet.
- The Multi-DSL Router bridges the IP packets between WAN and LAN ports, unless the packet is addressed to the Router's LAN IP address.

Use Static IP Address

Unless your service provider specially requires this setup, do not select it.

If selected, enter your static IP address.

Enable PPP Debug Mode

Enable the PPPoE debug mode. The system will put more PPP connection information in System Log. But this is for debug, please don't enable in normal usage.

2. Click **Next** to display the following screen.

End IP Address:

Leased Time (hour):

☐ Configure the second IP Address and Subnet Mask for LAN interface

Back Next

The Device Setup page allows the user to configure the LAN interface IP address and DHCP server. If the user would like this Multi-DSL Router to assign dynamic IP addresses, DNS server and default gateway to other LAN devices, select the radio box **Enable DHCP server on the LAN** to enter the starting IP address and end IP address and DHCP lease time. This configures the Router to automatically assign IP addresses, default gateway address and DNS server addresses to each of your PCs.

Note that the Router's default IP address is 192.168.1.1 and the default private address range provided by the DHCP server in the Router is 192.168.1.2 through 192.168.1.254.

To configure a secondary IP address for the LAN port, click the box as shown below.

☒ Configure the second IP Address and Subnet Mask for LAN interface

IP Address:

Subnet Mask:

4. The following screen will be displayed. To enable the wireless function, select the box (by clicking on it) and input the SSID. Then, click **Next**.

5. Click **Next** to display the WAN Setup-Summary screen that presents the entire configuration summary. Click **Save/Reboot** if the settings are correct. Click **Back** if you wish to modify the settings.

VPI / VCI:	0 / 35
Connection Type:	PPPoE
Service Name:	pppoe_0_35_1
Service Category:	UBR
IP Address:	Automatically Assigned
Service State:	Enabled
NAT:	Enabled
Firewall:	Enabled
IGMP Multicast:	Disabled
Quality Of Service:	Disabled

6. After clicking **Save/Reboot**, the Router will save the configuration to the flash memory, and reboot. The Web UI will not respond until the system is brought up again. After the system is up, the Web UI will refresh to the Device Info page automatically. The CT-6373 is ready for operation and the LEDs display as described in the LED description tables.

5.2.2 MAC Encapsulation Routing (MER)

To configure MER, do the following.

1. Select **Quick Setup** and click **Next**.
2. Enter the PVC Index provided by the ISP and click **Next**.
3. Select the MAC Encapsulation Routing (MER) radio button, and click **Next**. The following screen appears.

The screenshot shows the WAN IP Settings page of a COMTREND ADSL Router. The page has a blue header with the COMTREND logo and 'ADSL Router' text. On the left is a navigation menu with options: Device Info, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, and Management. The main content area is titled 'WAN IP Settings' and contains a notice about DHCP and static configurations. Below the notice are three sections, each with a radio button for automatic configuration and a section for manual configuration with input fields. The first section is for IP address, the second for default gateway, and the third for DNS server addresses. At the bottom right are 'Back' and 'Next' buttons.

WAN IP Settings

Enter information provided to you by your ISP to configure the WAN IP settings.
Notice: DHCP can be enabled for PVC in MER mode or IP over Ethernet as WAN interface if "Obtain an IP address automatically" is chosen. Changing the default gateway or the DNS effects the whole system. Configuring them with static values will disable the automatic assignment from DHCP or other WAN connection.
If you configure static default gateway over this PVC in MER mode, you must enter the IP address of the remote gateway in the "Use IP address". The "Use WAN interface" is optional.

☒ Obtain an IP address automatically
☐ Use the following IP address:
WAN IP Address:
WAN Subnet Mask:

☒ Obtain default gateway automatically
☐ Use the following default gateway:
☐ Use IP Address:
☒ Use WAN Interface: mer_0_35/nas_0_35

☒ Obtain DNS server addresses automatically
☐ Use the following DNS server addresses:
Primary DNS server:
Secondary DNS server:

Back Next

Enter information provided to you by your ISP to configure the WAN IP settings.

Notice: DHCP can be enabled for PVC in MER mode if **Obtain an IP address automatically** is chosen. Changing the default gateway or the DNS affects the whole system. Configuring them with static values will disable the automatic assignment from DHCP or other WAN connection.

If you configure static default gateway over this PVC in MER mode, you must enter the IP address of the remote gateway in the "Use IP address". The "Use WAN interface" is optional.

The ISP should provide the values that must be entered in the entry fields.

4. Click **Next** to display the following screen.

The screenshot shows the 'Network Address Translation Settings' page of a COMTREND ADSL Router. On the left is a navigation menu with options: Device Info, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, and Management. The main content area has a title 'Network Address Translation Settings' and a descriptive paragraph: 'Network Address Translation (NAT) allows you to share one Wide Area Network (WAN) IP address for multiple computers on your Local Area Network (LAN)'. Below this are three checkboxes: 'Enable NAT' (unchecked), 'Enable Firewall' (unchecked), and 'Enable IGMP Multicast, and WAN Service'. Under the third checkbox, there are two more checkboxes: 'Enable IGMP Multicast' (unchecked) and 'Enable WAN Service' (checked). Below these is a 'Service Name' field with the text 'mer_0_35' entered. At the bottom right are 'Back' and 'Next' buttons.

Enable NAT checkbox: If the LAN is configured with a private IP address, the user should select this checkbox. The NAT submenu on the left side main panel will be displayed after reboot. The user can then configure NAT-related features after the system comes up. If a private IP address is not used on the LAN side, this checkbox should be de-selected to free up system resources for better performance. When the system comes back after reboot, the NAT submenu will not be displayed on the left main panel.

Enable Firewall checkbox: If the firewall checkbox is selected, the firewall submenu on the left side main panel will be displayed after system reboot. The user can then configure firewall features after the system comes up. If firewall is not used, this checkbox should be de-selected to free up system resources for better performance. When system comes back after reboot, the Firewall submenu will not be displayed on the left main panel.

Enable IGMP Multicast: Tick the checkbox to enable IGMP multicast (proxy). IGMP (Internet Group Membership Protocol) is a protocol used by IP hosts to report their multicast group memberships to any immediately neighboring multicast Routers.

Enable WAN Service: Tick the checkbox to enable the WAN (ADSL) service. If this item is not selected, you will not be able to use the ADSL service. The default setting for Mer is enable.

Service Name: This is User-defined.

5. Upon completion, click **Next**. The following screen appears.

COMTREND ADSL Router

Device Setup

Configure the DSL Router IP Address and Subnet Mask for LAN interface.

IP Address:

Subnet Mask:

☐ Disable DHCP Server

☒ Enable DHCP Server

Start IP Address:

End IP Address:

Leased Time (hour):

☐ Enable DHCP Server Relay

DHCP Server IP Address:

☐ Configure the second IP Address and Subnet Mask for LAN interface

The Device Setup page allows the user to configure the LAN interface IP address and DHCP server. If the user would like this Multi-DSL Router to assign dynamic IP addresses, DNS server and default gateway to other LAN devices, select the radio box **Enable DHCP server on the LAN** to enter the starting IP address and end IP address and DHCP lease time. This configures the Router to automatically assign IP addresses, default gateway address and DNS server addresses to each of your PCs.

Note that the Router's default IP address is 192.168.1.1 and the default private address range provided by the DHCP server in the Router is 192.168.1.2 through 192.168.1.254.

Select **Enable DHCP Server Relay** (if required), and enter the DHCP Server IP Address. This allows the Router to relay the DHCP packets to the remote DHCP server. The remote DHCP server will provide the IP address.

To configure a secondary IP address for the LAN port, click the box as shown below.

A configuration box with a title bar that says "Configure the second IP Address and Subnet Mask for LAN interface". The title bar has a checkbox with a checkmark inside a red circle. Below the title bar are two input fields: "IP Address:" and "Subnet Mask:". Both fields are empty.

After entering your settings, select **Next** to display the following screen.

6. The following screen will be displayed. To enable the wireless function, select the box (by clicking on it) and input the SSID. Then, click **Next**.

The screenshot shows the Comtrend ADSL Router's web interface. The top banner features the Comtrend logo and "ADSL Router" text. On the left is a navigation menu with links: "Device Info", "Quick Setup", "Advanced Setup", "Wireless", "Voice", "Diagnostics", and "Management". The main content area is titled "Wireless -- Setup". It contains a checkbox labeled "Enable Wireless" which is checked. Below this is a text prompt: "Enter the wireless network name (also known as SSID).". Under the prompt is an input field labeled "SSID:" containing the text "Comtrend". At the bottom right of the main area are two buttons: "Back" and "Next".

The following screen will be displayed.

IGMP Multicast:	Disabled
Quality Of Service:	Disabled

Click "Save/Reboot" to save these settings and reboot router. Click "Back" to make any modifications.
NOTE: The configuration process takes about 1 minute to complete and your DSL Router will reboot.

[Back](#) [Save/Reboot](#)

The WAN Setup-Summary screen presents the entire configuration summary. Click **Save/Reboot** if the settings are correct. Click **Back** if you wish to modify the settings.

7. After clicking **Save/Reboot**, the Router will save the configuration to the flash memory, and reboot. The Web UI will not respond until the system is brought up again. After the system is up, the Web UI will refresh to the Device Info page automatically. The CT-6373 is ready for operation and the LEDs display as described in the LED description tables.

5.2.3 IP Over ATM

To configure IP Over ATM,

1. Select **Quick Setup** and click **Next**.
2. Enter the PVC Index and click **Next**.
3. Type the VPI and VCI values provided by the ISP and click **Next**.
4. Select the IP over ATM (IPoA) radio button and click **Next**. The following screen appears.

The screenshot shows the 'WAN IP Settings' page of a COMTREND ADSL Router. The page has a blue header with the COMTREND logo and 'ADSL Router' text. On the left, there is a vertical menu with options: Device Info, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, and Management. The main content area is titled 'WAN IP Settings' and contains the following text: 'Enter information provided to you by your ISP to configure the WAN IP settings.' and a notice: 'Notice: DHCP is not supported in IPoA mode. Changing the default gateway or the DNS effects the whole system. Configuring them with static values will disable the automatic assignment from other WAN connection.' Below this, there are input fields for 'WAN IP Address:' and 'WAN Subnet Mask:'. There are two main sections for configuration, each starting with a checkbox. The first section is 'Use the following default gateway:' with sub-options 'Use IP Address:' (with an input field) and 'Use WAN Interface:' (with a dropdown menu showing 'ipoa_0_35/ipa_0_35'). The second section is 'Use the following DNS server addresses:' with sub-options 'Primary DNS server:' and 'Secondary DNS server:' (both with input fields). At the bottom right, there are 'Back' and 'Next' buttons.

Notice that DHCP client is not supported over IPoA. The user must enter the IP address or WAN interface for the default gateway setup, and the DNS server addresses provided by the ISP.

5. Click **Next**. The following screen appears.

☐ Enable DHCP Server Relay

DHCP Server IP Address:

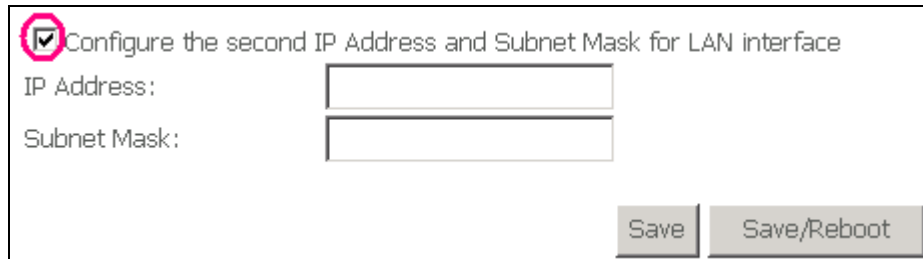

☐ Configure the second IP Address and Subnet Mask for LAN interface

Enable IGMP Snooping: Enable IGMP Snooping function by ticking the box.

Standard Mode: In standard mode, as in all prior releases, multicast traffic will flood to all bridge ports when there is no client subscribes to any multicast group – even when IGMP snooping is enabled.

Blocking Mode: In blocking mode, the multicast data traffic will be blocked and not flood to all bridge ports when there is no client subscription to any multicast group.

To configure a secondary IP address for the LAN port, click the box as shown below.

The screenshot shows a configuration window with a checkbox labeled "Configure the second IP Address and Subnet Mask for LAN interface". The checkbox is checked and is circled in red. Below the checkbox are two input fields: "IP Address:" and "Subnet Mask:". At the bottom right of the window are two buttons: "Save" and "Save/Reboot".

IP Address: Enter the secondary IP address for the LAN port.

Subnet Mask: Enter the secondary subnet mask for the LAN port.

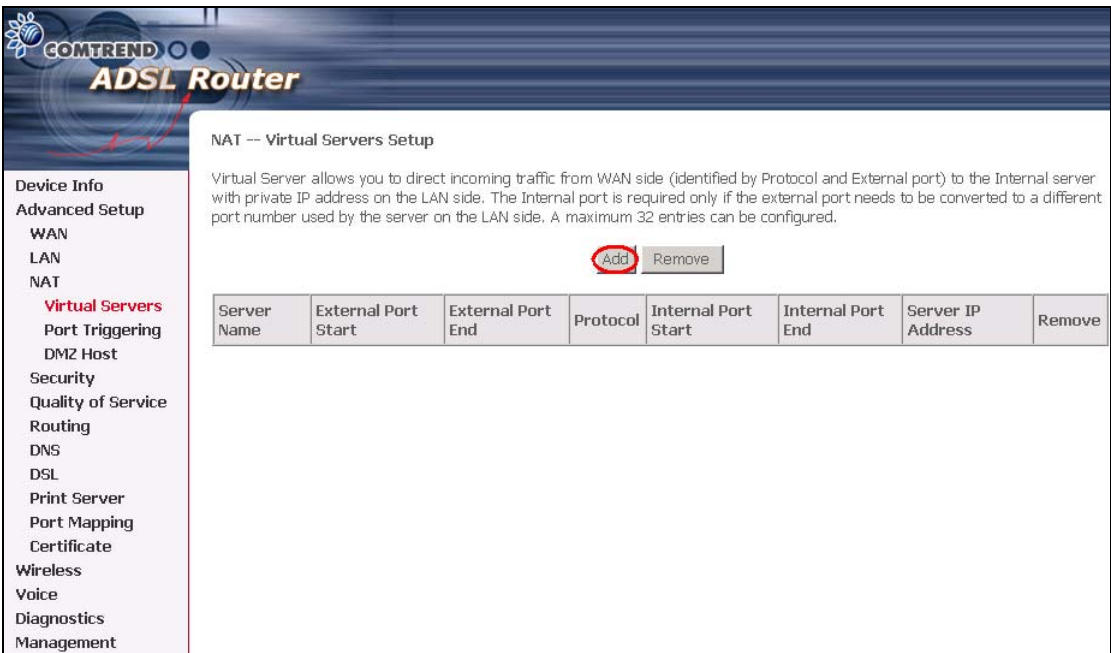

6.3 NAT

To display the NAT function, you need to enable the NAT feature in the WAN Setup.

6.3.1 Virtual Servers

Virtual Server allows you to direct incoming traffic from WAN side (identified by Protocol and External port) to the Internal server with private IP address on the LAN side. The Internal port is required only if the external port needs to be converted to a different port number used by the server on the LAN side. A maximum 32 entries can be configured.

To add a Virtual Server, simply click the Add button. The following will be displayed.

Select a Service Or Custom Server	User should select the service from the list. Or User can enter the name of their choice.
Server IP Address	Enter the IP address for the server.
External Port Start	Enter the starting external port number (when you select Custom Server). When a service is selected the port ranges are automatically configured.
External Port End	Enter the ending external port number (when you select Custom Server). When a service is selected the port ranges are automatically configured.
Protocol	User can select from: TCP, TCP/UDP or UDP.
Internal Port Start	Enter the internal port starting number (when you select Custom Server). When a service is selected the port ranges are automatically configured
Internal Port End	Enter the internal port ending number (when you select Custom Server). When a service is selected the port ranges are automatically configured.

6.3.2 Port Triggering

Some applications require that specific ports in the Router's firewall be opened for access by the remote parties. Port Trigger dynamically opens up the 'Open Ports' in the firewall when an application on the LAN initiates a TCP/UDP connection to a remote party using the 'Triggering Ports'. The Router allows the remote party from the WAN side to establish new connections back to the application on the LAN side using the 'Open Ports'. A maximum 32 entries can be configured.

Trigger Port Start	Enter the starting trigger port number (when you select custom application). When an application is selected the port ranges are automatically configured.
Trigger Port End	Enter the ending trigger port number (when you select custom application). When an application is selected the port ranges are automatically configured.
Trigger Protocol	User can select from: TCP, TCP/UDP or UDP.
Open Port Start	Enter the starting open port number (when you select custom application). When an application is selected the port ranges are automatically configured.
Open Port End	Enter the ending open port number (when you select custom application). When an application is selected the port ranges are automatically configured.
Open Protocol	User can select from: TCP, TCP/UDP or UDP.

6.3.3 DMZ Host

The Multi-DSL Router will forward IP packets from the WAN that do not belong to any of the applications configured in the Virtual Servers table to the DMZ host computer.

The screenshot shows the web interface of a COMTREND ADSL Router. On the left is a navigation menu with the following items: Device Info, Advanced Setup, WAN, LAN, NAT, Virtual Servers, Port Triggering, DMZ Host (highlighted in red), Security, Quality of Service, Routing, DNS, DSL, Print Server, Port Mapping, Certificate, Wireless, Voice, Diagnostics, and Management. The main content area is titled "NAT -- DMZ Host". It contains the following text: "The DSL router will forward IP packets from the WAN that do not belong to any of the applications configured in the Virtual Servers table to the DMZ host computer.", "Enter the computer's IP address and click 'Apply' to activate the DMZ host.", and "Clear the IP address field and click 'Apply' to deactivate the DMZ host.". Below this text is a label "DMZ Host IP Address:" followed by an empty text input field. At the bottom right of the main area is a "Save/Apply" button.

Enter the computer's IP address and click "Apply" to activate the DMZ host.

Clear the IP address field and click "Apply" to deactivate the DMZ host.

6.4 Security

To display the Security function, you need to enable the firewall feature in the WAN Setup.

6.4.1 IP Filtering

IP filtering allows you to create a filter rule to identify outgoing/incoming IP traffic by specifying a new filter name and at least one condition below. All of the specified conditions in this filter rule must be satisfied for the rule to take effect. Click 'Save/Apply' to save and activate the filter.

Outgoing

Note: The default setting for all Outgoing traffic is Accepted.

The screenshot shows the COMTREND ADSL Router web interface. On the left is a navigation menu with the following items: Device Info, Advanced Setup, WAN, LAN, NAT, Security (highlighted in red), IP Filtering, Parental Control, Quality of Service, Routing, DNS, DSL, Print Server, Port Mapping, Certificate, Wireless, Voice, Diagnostics, and Management. The main content area is titled 'Outgoing IP Filtering Setup'. It contains the following text: 'By default, all outgoing IP traffic from LAN is allowed, but some IP traffic can be **BLOCKED** by setting up filters.' and 'Choose Add or Remove to configure outgoing IP filters.' Below this text is a table with the following headers: Filter Name, Protocol, Source Address / Mask, Source Port, Dest. Address / Mask, Dest. Port, and Remove. Below the table are two buttons: 'Add' and 'Remove'.

Filter Name	Protocol	Source Address / Mask	Source Port	Dest. Address / Mask	Dest. Port	Remove
-------------	----------	-----------------------	-------------	----------------------	------------	--------

To add a filtering rule, simply click the Add button. The following screen will be displayed.

COMTREND ADSL Router

Add IP Filter -- Outgoing

The screen allows you to create a filter rule to identify outgoing IP traffic by specifying a new filter name and at least one condition below. All of the specified conditions in this filter rule must be satisfied for the rule to take effect. Click 'Save/Apply' to save and activate the filter.

Filter Name:

Protocol:

Source IP address:

Source Subnet Mask:

Source Port (port or port:port):

Destination IP address:

Destination Subnet Mask:

Destination Port (port or port:port):

Filter Name	Type a name for the filter rule.
Protocol	User can select from: TCP, TCP/UDP, UDP or ICMP.
Source IP address	Enter source IP address.
Source Subnet Mask	Enter source subnet mask.
Source Port (port or port:port)	Enter source port number/port range.
Destination IP address	Enter destination IP address.
Destination Subnet Mask	Enter destination subnet mask.
Destination port (port or port:port)	Enter destination port number/port range.

Incoming

Note: The default setting for all Incoming traffic is Blocked.

The screenshot shows the 'Incoming IP Filtering Setup' page. On the left is a navigation menu with categories: Device Info, Advanced Setup (WAN, LAN, NAT, Security, IP Filtering, Outgoing, Incoming, Parental Control, Quality of Service, Routing, DNS, DSL, Print Server, Port Mapping, Certificate), Wireless, Voice, Diagnostics, and Management. The 'Incoming' option under IP Filtering is highlighted. The main content area is titled 'Incoming IP Filtering Setup' and contains the following text: 'By default, all incoming IP traffic from the WAN is blocked when the firewall is enabled. However, some IP traffic can be **ACCEPTED** by setting up filters.' and 'Choose Add or Remove to configure incoming IP filters.' Below this is a table with 8 columns: Filter Name, VPI/VCI, Protocol, Source Address / Mask, Source Port, Dest. Address / Mask, Dest. Port, and Remove. Below the table are 'Add' and 'Remove' buttons.

Filter Name	VPI/VCI	Protocol	Source Address / Mask	Source Port	Dest. Address / Mask	Dest. Port	Remove
-------------	---------	----------	-----------------------	-------------	----------------------	------------	--------

To add a filtering rule, simply click the Add button. The following screen will be displayed.

The screenshot shows the 'Add IP Filter -- Incoming' page. The left navigation menu is the same as the previous screenshot, with 'Incoming' highlighted. The main content area is titled 'Add IP Filter -- Incoming' and contains the following text: 'The screen allows you to create a filter rule to identify incoming IP traffic by specifying a new filter name and at least one condition below. All of the specified conditions in this filter rule must be satisfied for the rule to take effect. Click 'Save/Apply' to save and activate the filter.' Below this are input fields for: Filter Name, Protocol (a dropdown menu), Source IP address, Source Subnet Mask, Source Port (port or port:port), Destination IP address, Destination Subnet Mask, and Destination Port (port or port:port). Below these fields is a section titled 'WAN Interfaces (Configured in Routing mode and with firewall enabled only)' with the instruction 'Select at least one or multiple WAN interfaces displayed below to apply this rule.' There are two checkboxes: 'Select All' (checked) and 'pppoe_0_35_1/ppp_0_35_1' (checked). At the bottom right is a 'Save/Apply' button.

To configure the parameters, please reference **Outgoing** table above.

6.4.2 Parental Control

Parental control: allows parents, schools, and libraries to set access times for Internet use.

COMTREND ADSL Router

Time of Day Restrictions — A maximum 16 entries can be configured.

6.4.3 MAC Filtering

Mac Filtering is only available when Bridging PVC is configured.

Each network device has a unique MAC address. You can block or forward the packets based on the MAC addresses. The MAC Filtering Setup screen allows setting up the MAC filtering policy and the MAC filtering rules. MAC Filtering is only effective on ATM PVCs configured in Bridge mode.

The policy **FORWARDED** means that all MAC layer frames will be **FORWARDED** except those matching with any of the specified rules in the following table.

BLOCKED means that all MAC layer frames will be **BLOCKED** except those matching with any of the specified rules in the following table. The default is FORWARD; you change by clicking the **Change Policy** button.

COMTREND ADSL Router

Add Network Traffic Class Rule

The screen creates a traffic class rule to classify the upstream traffic, assign queuing priority and optionally overwrite the IP header TOS byte. A rule consists of a class name and at least one condition below. All of the specified conditions in this classification rule must be satisfied for the rule to take effect. Click 'Save/Apply' to save and activate the rule.

Traffic Class Name:

☐ Enable Differentiated Service Configuration

Assign ATM Priority and/or IP Precedence and/or Type Of Service for the class
If non-blank value is selected for 'Mark IP Precedence' and/or 'Mark IP Type Of Service', the corresponding TOS byte in the IP header of the upstream packet is overwritten by the selected value.

Note: If Differentiated Service Configuration checkbox is selected, you will only need to assign ATM priority. IP Precedence will not be used for classification. IP TOS byte will be used for DSCP mark.

Assign ATM Transmit Priority:

Mark IP Precedence:

Mark IP Type Of Service:

Mark 802.1p if 802.1q is enabled on WAN:

Specify Traffic Classification Rules
Enter the following conditions either for IP level, SET-1, or for IEEE 802.1p, SET-2.

SET-1

Physical LAN Port:

Protocol:

Source IP Address:

Source Subnet Mask:

UDP/TCP Source Port (port or port:port):

Destination IP Address:

Destination Subnet Mask:

UDP/TCP Destination Port (port or port:port):

SET-2

802.1p Priority:

The screen creates a traffic class rule to classify the upstream traffic, assign queuing priority and optionally overwrite the IP header TOS byte. A rule consists of a class name and at least one condition below. All of the specified conditions in this classification rule must be satisfied for the rule to take effect. Click 'Save/Apply' to save and activate the rule.

Traffic Class Name	Enter name for traffic class.
Enable Differentiated Service Configuration	Enable Differentiated Service Configuration if required.
Assign ATM Transmit Priority	Select Low, Medium or High.
Mark IP Precedence	<p>Select between 0-7. The lower the digit shows the higher the priority</p> <p>If non-blank value is selected for 'Mark IP Precedence' and/or 'Mark IP Type Of Service', the corresponding TOS byte in the IP header of the upstream packet is overwritten by the selected value.</p>

	<p>Note: If Differentiated Service Configuration checkbox is selected, you will only need to assign ATM priority. IP Precedence will not be used for classification. IP TOS byte will be used for DSCP mark.</p>
IP Type Of Service	<p>Select either: Normal Service, Minimize Cost, Maximize Reliability, Maximize Throughput, Minimize Delay</p> <p>If non-blank value is selected for 'Mark IP Precedence' and/or 'Mark IP Type Of Service', the corresponding TOS byte in the IP header of the upstream packet is overwritten by the selected value.</p> <p>Note: If Differentiated Service Configuration checkbox is selected, you will only need to assign ATM priority. IP Precedence will not be used for classification. IP TOS byte will be used for DSCP mark.</p>
Assign Differentiated Services Code Point (DSCP) Mark	Choose the required DSCP value. Default value is "000000".
Mark 802.1p if 802.1q is enabled on WAN	Select between 0-7.
<p>Specify Traffic Classification Rules</p> <p>Enter the following conditions either for physical LAN/Wireless port or for IP level, SET-1, or for IEEE 802.1p, SET-2</p>	
SET-1	
Physical LAN Port	User can select from: ENET, ENET(1-4), USB, Wireless or Wireless_Guest.
Protocol	User can select from: TCP, TCP/UDP, UDP or ICMP.
Source IP Address	Enter the source IP address.
Source Subnet Mask	Enter the subnet mask for the source IP address.
Source Port (port or port:port)	Enter source port number or range.
Destination IP address	Enter destination IP address.
Destination Subnet Mask	Enter destination subnet mask.
Destination port (port or port:port)	Enter destination port number or range.

SET-2	
802.1p Priority	Select between 0-7. The lower the digit shows the higher the priority

If the **Enable Differentiated Service Configuration** box is ticked (i.e. selected) the following screen will be displayed:

COMTREND ADSL Router

Add Network Traffic Class Rule

The screen creates a traffic class rule to classify the upstream traffic, assign queuing priority and optionally overwrite the IP header TOS byte. A rule consists of a class name and at least one condition below. All of the specified conditions in this classification rule must be satisfied for the rule to take effect. Click 'Save/Apply' to save and activate the rule.

Traffic Class Name:

☒ Enable Differentiated Service Configuration

Assign ATM Priority and/or IP Precedence and/or Type Of Service for the class
 If non-blank value is selected for 'Mark IP Precedence' and/or 'Mark IP Type Of Service', the corresponding TOS byte in the IP header of the upstream packet is overwritten by the selected value.

Note: If Differentiated Service Configuration checkbox is selected, you will only need to assign ATM priority. IP Precedence will not be used for classification. IP TOS byte will be used for DSCP mark.

Assign ATM Transmit Priority:

Assign Differentiated Services Code Point (DSCP) Mark:

Mark 802.1p if 802.1q is enabled on WAN:

Specify Traffic Classification Rules
 Enter the following conditions either for IP level, SET-1, or for IEEE 802.1p, SET-2.

SET-1

Physical LAN Port:

Protocol:

Source IP Address:

Source Subnet Mask:

UDP/TCP Source Port (port or port:port):

Destination IP Address:

Destination Subnet Mask:

UDP/TCP Destination Port (port or port:port):

Source MAC Address:

Source MAC Mask:

Destination MAC Address:

Destination MAC Mask:

SET-2

802.1p Priority:

Save/Apply

The additional Items are explained here.

Assign Differentiated Services Code Point (DSCP) Mark	The selected Code Point gives the corresponding priority to the packets that satisfies the rules set below.
Source MAC Address	A packet belongs to SET-1, if a binary-AND of its source MAC address with the Source MAC Mask is equal to the binary-AND of the Source MAC Mask and this field.

Source MAC Mask	This is the mask used to decide how many bits are checked in Source MAC Address.
Destination MAC Address	A packet belongs to SET-1 then the result that the Destination MAC Address of its header binary-AND to the Destination MAC Mask must equal to the result that this field binary-AND to the Destination MAC Mask.
Destination MAC Mask	This is the mask used to decide how many bits are checked in Destination MAC Address.

6.6 Routing

The Routing dialog box allows you to configure Default gateway, Static Route and RIP.

6.6.1 Default Gateway

If '**Enable Automatic Assigned Default Gateway**' checkbox is selected, this Router will accept the first received default gateway assignment from one of the PPPoA, PPPoE or MER/DHCP enabled PVC(s). If the checkbox is not selected, enter the static default gateway AND/OR a WAN interface. Click 'Save/Apply' button to save it.

NOTE: If changing the Automatic Assigned Default Gateway from unselected to selected, You must reboot the Router to get the automatic assigned default gateway.

The screenshot displays the web interface of a COMTREND ADSL Router. The left sidebar contains a navigation menu with the following items: Device Info, Advanced Setup, WAN, LAN, NAT, Security, Quality of Service, Routing, Default Gateway (highlighted in red), Static Route, RIP, DNS, DSL, Print Server, Port Mapping, Certificate, Wireless, Voice, Diagnostics, and Management. The main content area is titled 'Routing -- Default Gateway' and contains the following text: 'If Enable Automatic Assigned Default Gateway checkbox is selected, this router will accept the first received default gateway assignment from one of the PPPoA, PPPoE or MER/DHCP enabled PVC(s). If the checkbox is not selected, enter the static default gateway AND/OR a WAN interface. Click 'Save/Apply' button to save it.' Below this text is a note: 'NOTE: If changing the Automatic Assigned Default Gateway from unselected to selected, You must reboot the router to get the automatic assigned default gateway.' A checkbox labeled 'Enable Automatic Assigned Default Gateway' is checked. At the bottom right of the main content area is a 'Save/Apply' button.

6.6.2 Static Route

Choose **Static Route** to display the Static Route screen. The Static Route screen lists the configured static routes, and allows configuring static routes. Choose **Add** or **Remove** to configure the static routes.

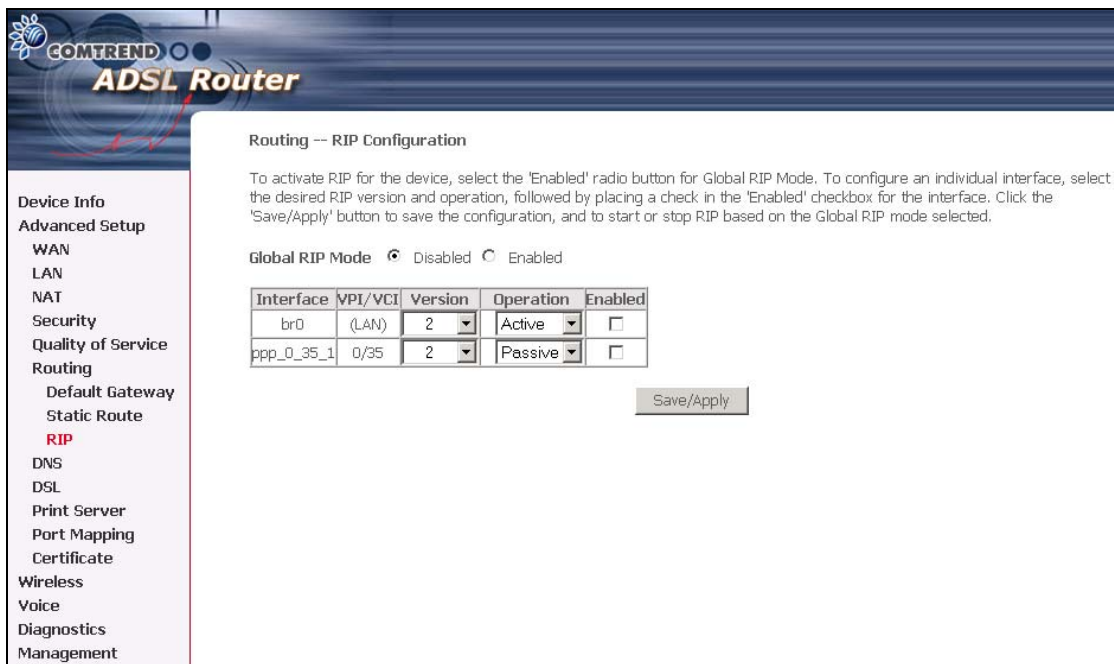

The screenshot shows the 'Static Route' configuration page of a COMTREND ADSL Router. The left sidebar contains a menu with the following items: Device Info, Advanced Setup (WAN, LAN, NAT), Security, Quality of Service, Routing (Default Gateway, Static Route, RIP), DNS, DSL, Print Server, Port Mapping, Certificate, Wireless, Voice, Diagnostics, and Management. The 'Static Route' option is highlighted in red. The main content area is titled 'Routing -- Static Route (A maximum 32 entries can be configured)'. It features a table with headers: Destination, Subnet Mask, Gateway, Interface, and Remove. Below the table are 'Add' and 'Remove' buttons.

To add static route, click the **Add** button to display the following screen. Enter the destination network address, subnet mask, gateway AND/OR available WAN interface then click **Save/Apply** to add the entry to the routing table.

The screenshot shows the 'Static Route Add' configuration page. The left sidebar is identical to the previous screen, with 'Static Route' highlighted. The main content area is titled 'Routing -- Static Route Add'. It contains the instruction: 'Enter the destination network address, subnet mask, gateway AND/OR available WAN interface then click "Save/Apply" to add the entry to the routing table.' Below this are input fields for 'Destination Network Address:' and 'Subnet Mask:'. There are two checkboxes: 'Use Gateway IP Address' (unchecked) and 'Use Interface' (checked). The 'Use Interface' checkbox is followed by a dropdown menu showing 'pppoe_0_35_1/ppp_0_35_1'. A 'Save/Apply' button is located at the bottom right of the form.

6.6.3 RIP

To activate RIP for the device, select the 'Enabled' radio button for Global RIP Mode. To configure an individual interface, select the desired RIP version and operation, followed by placing a check in the 'Enabled' checkbox for the interface. Click the 'Save/Apply' button to save the configuration, and to start or stop RIP based on the Global RIP mode selected.

The screenshot shows the 'Routing -- RIP Configuration' page of a Comtrend ADSL Router. The left sidebar contains a menu with options: Device Info, Advanced Setup, WAN, LAN, NAT, Security, Quality of Service, Routing, Default Gateway, Static Route, RIP (highlighted in red), DNS, DSL, Print Server, Port Mapping, Certificate, Wireless, Voice, Diagnostics, and Management. The main content area has a title 'Routing -- RIP Configuration' and a descriptive text: 'To activate RIP for the device, select the 'Enabled' radio button for Global RIP Mode. To configure an individual interface, select the desired RIP version and operation, followed by placing a check in the 'Enabled' checkbox for the interface. Click the 'Save/Apply' button to save the configuration, and to start or stop RIP based on the Global RIP mode selected.'

Global RIP Mode ☒ Disabled ☐ Enabled

Interface	VPI/VCI	Version	Operation	Enabled
br0	(LAN)	2	Active	<input type="checkbox"/>
ppp_0_35_1	0/35	2	Passive	<input type="checkbox"/>

Save/Apply

Note: This screenshot is based on PPPoE encapsulation.

6.7 DNS

6.7.1 DNS Server

If 'Enable Automatic Assigned DNS' checkbox is selected, this Router will accept the first received DNS assignment from one of the PPPoA, PPPoE or MER/DHCP enabled PVC(s) during the connection establishment. If the checkbox is not selected, enter the primary and optional secondary DNS server IP addresses. Click 'Save' button to save the new configuration. You must reboot the Router to make the new configuration effective.

The screenshot shows the web interface of a COMTREND ADSL Router. The top header features the COMTREND logo and the text 'ADSL Router'. On the left is a vertical navigation menu with the following items: Device Info, Advanced Setup, WAN, LAN, NAT, Security, Quality of Service, Routing, DNS, **DNS Server** (highlighted in red), Dynamic DNS, DSL, Print Server, Port Mapping, Certificate, Wireless, Voice, Diagnostics, and Management. The main content area is titled 'DNS Server Configuration'. It contains a paragraph explaining the 'Enable Automatic Assigned DNS' checkbox. Below this paragraph is a checkbox labeled 'Enable Automatic Assigned DNS' which is checked. At the bottom right of the main content area is a 'Save' button.

- ☒ ADSL2+ Enabled
- ☐ AnnexM Enabled

Select the phone line pair below.

- ☒ Inner pair
- ☐ Outer pair

Capability

- ☒ Bitswap Enable
- ☐ SRA Enable

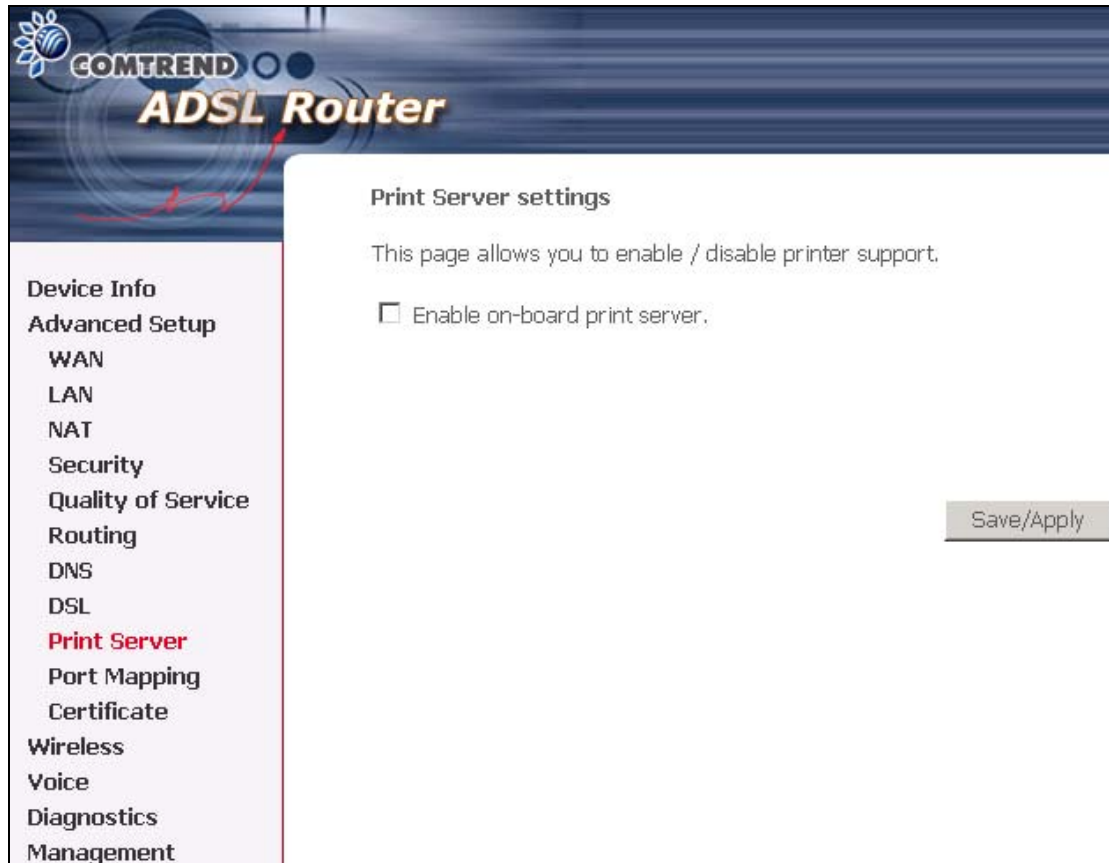

Save/Apply

Option	Description
(G.dmt, G.lite or T1.413)	Sets the system auto-sense between G.Dmt, G.lite, or T1.413
G.dmt/G.lite	Sets G.Dmt/G.lite if you want the system to use either G.Dmt or G.lite mode.
T1.413	Sets the T1.413 if you want the system to use only T1.413 mode.
ADSL2 Enabled	The device can support the functions of the ADSL2.
AnnexL Enabled	The device can support/enhance the long loop test.

ADSL2+ Enabled	The device can support the functions of the ADSL2+.
AnnexM	Covers a higher “upstream” data rate version, by making use of some of the downstream channels.
Inner Pair	Reserved only
Outer Pair	Reserved only
Bitswap Enable	Allows bitswapping function
SRA Enable	Allows seamless rate adaptation

6.9 Print Server

The CT-6373 is equipped with one high-speed USB2.0 host connection. With software support, users can connect USB devices such as a printer and hard disc to the CT-6373. For this software release, printer server is supported.

The screenshot displays the web management interface of a Comtrend ADSL Router. The top header features the Comtrend logo and the text "ADSL Router". On the left, a vertical navigation menu lists various configuration sections: Device Info, Advanced Setup, WAN, LAN, NAT, Security, Quality of Service, Routing, DNS, DSL, **Print Server** (highlighted in red), Port Mapping, Certificate, Wireless, Voice, Diagnostics, and Management. The main content area is titled "Print Server settings" and includes a descriptive sentence: "This page allows you to enable / disable printer support." Below this, there is a single checkbox labeled "Enable on-board print server," which is currently unchecked. A "Save/Apply" button is located in the bottom right corner of the settings area.

Please refer to Appendix A for an Example.

6.10 Port Mapping

Port Mapping supports multiple port to PVC and bridging groups. Each group will perform as an independent network. To support this feature, you must create mapping groups with appropriate LAN and WAN interfaces using the Add button. The Remove button will remove the grouping and add the ungrouped interfaces to the Default group.

As shown below, when you tick the Enable virtual ports on, all of the LAN interfaces will be grouped together as a default.

COMTREND ADSL Router

Port Mapping -- A maximum 16 entries can be configured

Port Mapping supports multiple ports to PVC and bridging groups. Each group will perform as an independent network. To support this feature, you must create mapping groups with appropriate LAN and WAN interfaces using the Add button. The Remove button will remove the grouping and add the ungrouped interfaces to the Default group. Only the default group has IP interface.

☐ Enable virtual ports on ENET(1-4)

Group Name	Interfaces	Remove	Edit
Default	ENET(1-4), USB, Wireless, Wireless_Guest		

Add Remove

Port Mapping -- A maximum 16 entries can be configured

Port Mapping supports multiple ports to PVC and bridging groups. Each group will perform as an independent network. To support this feature, you must create mapping groups with appropriate LAN and WAN interfaces using the Add button. The Remove button will remove the grouping and add the ungrouped interfaces to the Default group. Only the default group has IP interface.

☒ Enable virtual ports on ENET(1-4)

Group Name	Interfaces	Remove	Edit
Default	ENET1, ENET2, ENET3, ENET4, USB, Wireless, Wireless_Guest		

Add Remove

To add a port mapping group, simply click the Add button.

COMTREND ADSL Router

Port Mapping Configuration

To create a new mapping group:

1. Enter the Group name and select interfaces from the available interface list and add it to the grouped interface list using the arrow buttons to create the required mapping of the ports. The group name must be unique.
2. If you like to automatically add LAN clients to a PVC in the new group add the DHCP vendor ID string. By configuring a DHCP vendor ID string any DHCP client request with the specified vendor ID (DHCP option 60) will be denied an IP address from the local DHCP server.
Note that these clients may obtain public IP addresses
3. Click Save/Apply button to make the changes effective immediately

Note that the selected interfaces will be removed from their existing groups and added to the new group.

IMPORTANT If a vendor ID is configured for a specific client device, please **REBOOT** the client device attached to the modem to allow it to obtain an appropriate IP address.

Group Name:

Grouped Interfaces	Available Interfaces
<div style="border: 1px solid black; height: 60px; width: 100%;"></div>	ENET1 ENET2 ENET3 ENET4 USB Wireless Wireless_Guest

Automatically Add Clients With the following DHCP Vendor IDs

To create a group from the list, first enter the group name and then select from the available interfaces on the list.

Automatically Add Clients With the Following DHCP Vendor IDs:

Add support to automatically map LAN interfaces including Wireless and USB to PVC's using DHCP vendor ID (option 60). The local DHCP server will decline and send the requests to a remote DHCP server by mapping the appropriate LAN interface. This will be turned on when PortMapping is enabled.

In this example there are 4 PVCs (0/33, 0/36, 0/37, 0/38). 0/33 is for PPPoE and the others are for IP setup-box (video).

The Lan interfaces are ETH1, ETH2, ETH3, ETH4, Wireless and USB.

Port mapping configuration are:

1. Default : ENET1, ENET2, ENET3, ENET4, Wireless, Wireless_Guest and USB.
2. Video: nas_0_36, nas_0_37 and nas_0_38. The DHCP vendor ID is "Video".
The CPE's dhcp server is running on "Default". And ISP's dhcp server is running on

PVC 0/36. It is for setup-box use only.

In the LAN side, PC can get IP address from CPE's dhcp server and access internet via PPPoE (0/33).

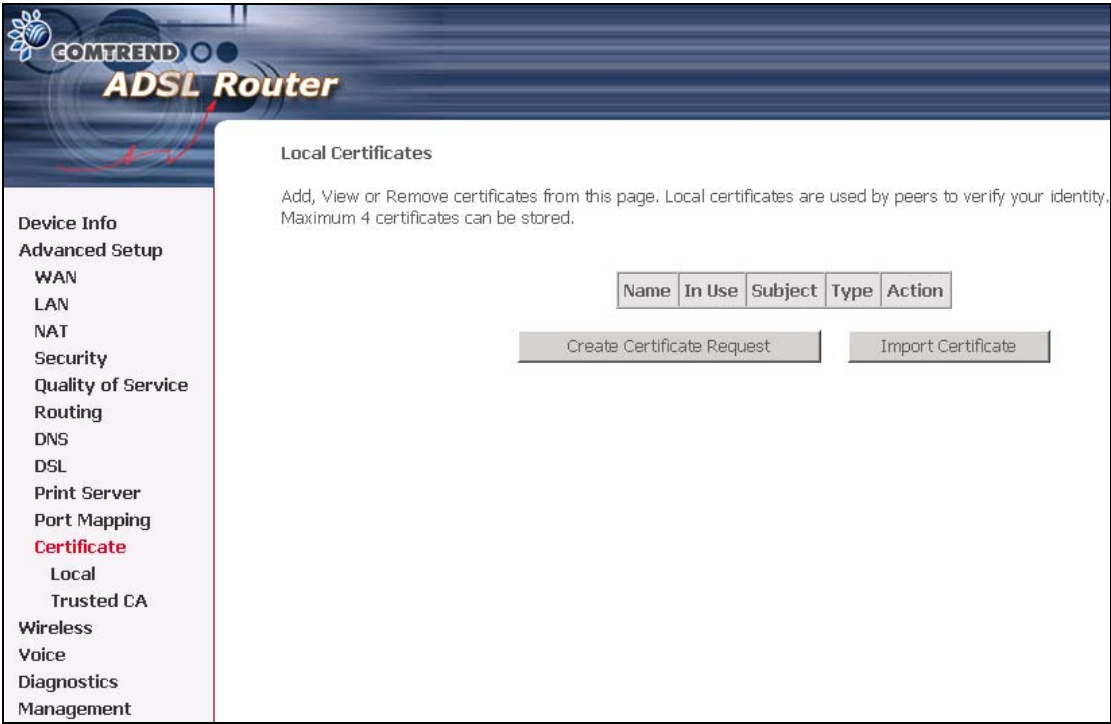

If the setup-box was connected with interface "ENET1" and send a dhcp request with vendor id "Video", CPE's dhcp server will forward this request to ISP's dhcp server.

And CPE will change the portmapping configuration automatically. The portmapping configuration will become:

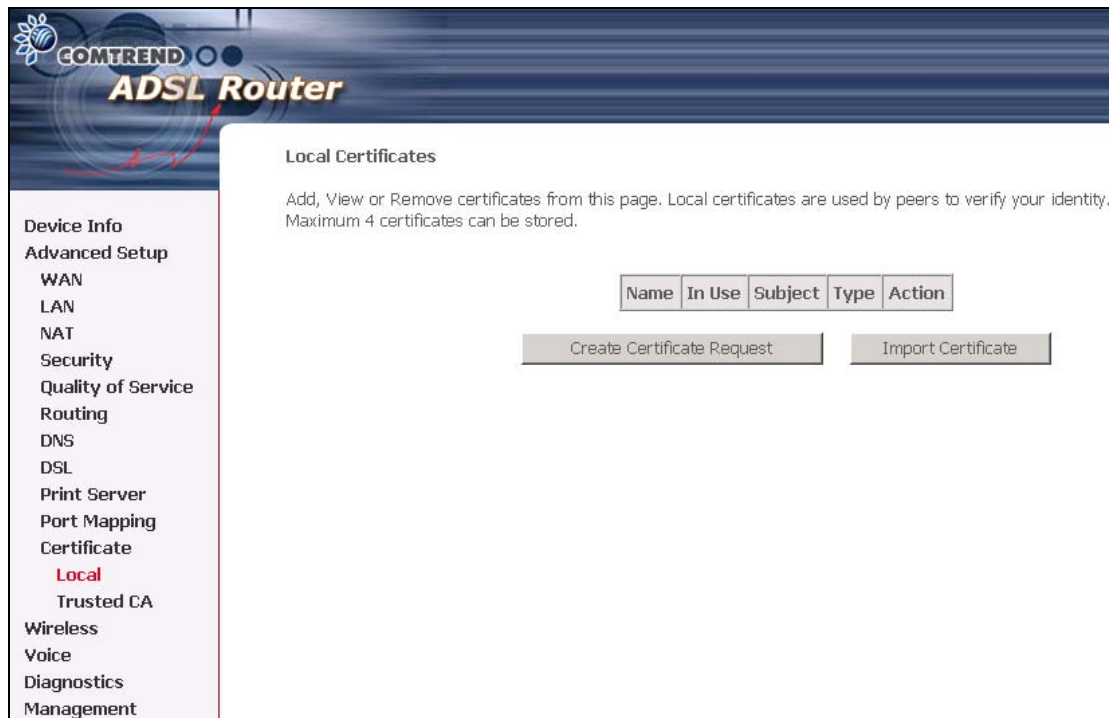

1. Default : ENET2, ENET3, ENET4, Wireless, Wireless_Guest and USB.
2. Video: nas_0_36, nas_0_37, nas_0_38 and ENET1.

6.11 Certificate

A certificate is a public key, attached with its owner’s information (company name, server name, personal real name, contact e-mail, postal address, etc) and digital signatures. There will be one or more digital signatures attached on the certificate, indicating that these signers have verified that the owner information of this certificate is correct.

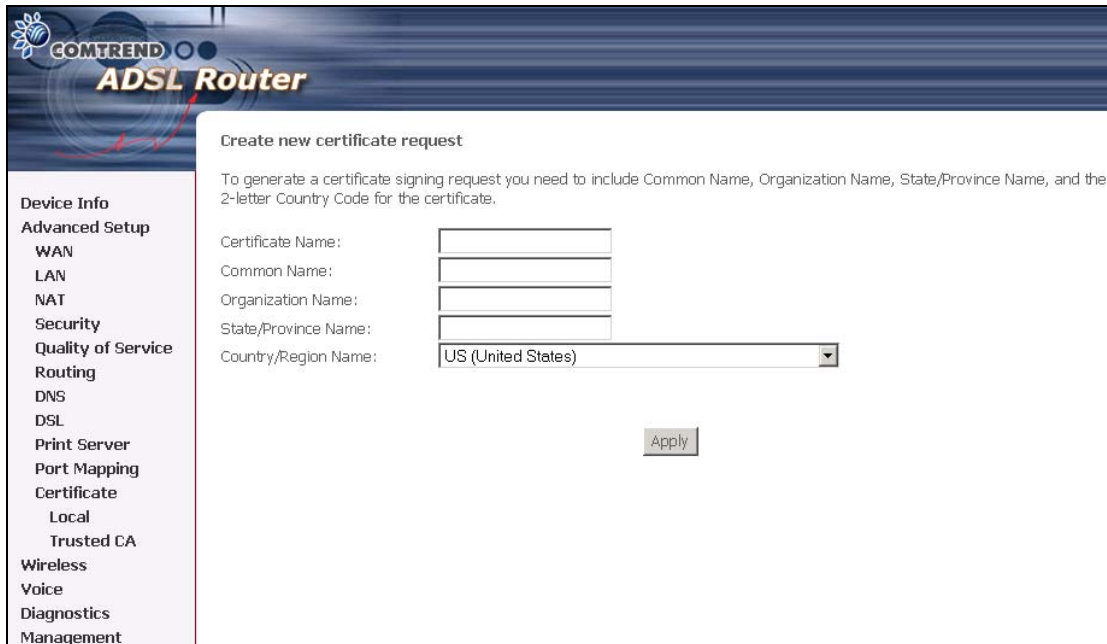

6.11.1 Local

Click **Create Certificate Request** to generate a certificate signing request. The certificate signing request can be submitted to the vendor/ISP/ITSP to apply for a certificate. Some information must be included in the certificate signing request. Actually, your vendor/ISP/ITSP will ask you to provide the information they require and to provide the information in the format they regulate. The explanation for each column in the following table is only for reference.

Certificate Name	A user-defined name for the certificate.
Common Name	Usually, it is the fully qualified domain name for the machine.
Organization Name	The exact legal name of your organization. Do not abbreviate.
State/Province Name	The state or province where your organization is located. It cannot be abbreviated.
Country/Region Name	The two-letter ISO abbreviation for your country.

COMTREND ADSL Router

Create new certificate request

To generate a certificate signing request you need to include Common Name, Organization Name, State/Province Name, and the 2-letter Country Code for the certificate.

6.11.2 Trusted CA

CA is the abbreviation for Certificate Authority. CA is a part of the X.509 system. It is itself a certificate, attached with the owner information of this certificate authority. But its purpose is not to do encryption/decryption. Its purpose is to sign and issue certificates; in order to prove the owner information of that certificate is correct.

The screenshot shows the COMTREND ADSL Router web interface. On the left is a navigation menu with the following items: Device Info, Advanced Setup, WAN, LAN, NAT, Security, Quality of Service, Routing, DNS, DSL, Print Server, Port Mapping, Certificate, Local, **Trusted CA**, Wireless, Voice, Diagnostics, and Management. The 'Trusted CA' item is highlighted in red. The main content area is titled 'Trusted CA (Certificate Authority) Certificates'. Below the title, it says: 'Add, View or Remove certificates from this page. CA certificates are used by you to verify peers' certificates. Maximum 4 certificates can be stored.' There is a table with four columns: Name, Subject, Type, and Action. Below the table is a button labeled 'Import Certificate'.

Click **Import Certificate** to paste the certificate content of your trusted CA. Generally speaking, the certificate content will be provided by your vendor/ISP/ITSP and is used to authenticate the Auto-Configuration Server (ACS) that the CPE will connect to.

The screenshot shows the 'Import CA certificate' page in the COMTREND ADSL Router web interface. The left navigation menu is the same as in the previous screenshot, with 'Trusted CA' highlighted. The main content area is titled 'Import CA certificate'. Below the title, it says: 'Enter certificate name and paste certificate content.' There is a text input field for 'Certificate Name:'. Below that is a large text area for 'Certificate:' containing the following text: '-----BEGIN CERTIFICATE-----', '<insert certificate here>', and '-----END CERTIFICATE-----'. At the bottom right of the main content area is an 'Apply' button.

Chapter 7 Wireless

The Wireless dialog box allows you to enable the wireless capability, hide the access point, set the wireless network name and restrict the channel set.

The screenshot shows the 'Wireless -- Basic' configuration page of a Comtrend ADSL Router. The left sidebar contains a menu with options: Device Info, Quick Setup, Advanced Setup, Wireless (highlighted), Basic (highlighted), Security, MAC Filter, Wireless Bridge, Advanced, Quality of Service, Station Info, Voice, Diagnostics, and Management. The main content area is titled 'Wireless -- Basic' and includes a description: 'This page allows you to configure basic features of the wireless LAN interface. You can enable or disable the wireless LAN interface, hide the network from active scans, set the wireless network name (also known as SSID) and restrict the channel set based on country requirements. Click "Apply" to configure the basic wireless options.' The configuration options are: 'Enable Wireless' (checked), 'Hide Access Point' (unchecked), 'SSID' (Comtrend), 'BSSID' (00:16:38:CC:E3:0F), 'Country' (UNITED STATES), 'Enable Wireless Guest Network' (unchecked), and 'Guest SSID' (Guest). A 'Save/Apply' button is at the bottom right.

7.1 Wireless Basic Screen

The Basic option allows you to configure basic features of the wireless LAN interface. You can enable or disable the wireless LAN interface, hide the network from active scans, set the wireless network name (also known as SSID) and restrict the channel set based on country requirements.

Click **Apply** to configure the basic wireless options.

This is a duplicate of the screenshot above, showing the 'Wireless -- Basic' configuration page of a Comtrend ADSL Router. The left sidebar contains a menu with options: Device Info, Quick Setup, Advanced Setup, Wireless, Basic (highlighted), Security, MAC Filter, Wireless Bridge, Advanced, Quality of Service, Station Info, Voice, Diagnostics, and Management. The main content area is titled 'Wireless -- Basic' and includes a description: 'This page allows you to configure basic features of the wireless LAN interface. You can enable or disable the wireless LAN interface, hide the network from active scans, set the wireless network name (also known as SSID) and restrict the channel set based on country requirements. Click "Apply" to configure the basic wireless options.' The configuration options are: 'Enable Wireless' (checked), 'Hide Access Point' (unchecked), 'SSID' (Comtrend), 'BSSID' (00:16:38:CC:E3:0F), 'Country' (UNITED STATES), 'Enable Wireless Guest Network' (unchecked), and 'Guest SSID' (Guest). A 'Save/Apply' button is at the bottom right.

Option	Description
Enable Wireless	A checkbox that enables or disables the wireless LAN interface. When selected, the Web UI displays Hide Access point, SSID, and Country settings. The default is Enable Wireless.
Hide Access Point	<p>Select Hide Access Point to protect Multi-DSL Router access point from detection by wireless active scans. If you do not want the access point to be automatically detected by a wireless station, this checkbox should be de-selected. The station will not discover this access point. To connect a station to the available access points, the station must manually add this access point name in its wireless configuration.</p> <p>In Windows XP, go to the Network>Programs function to view all of the available access points. You can also use other software programs such as NetStumbler to view available access points.</p>
SSID	<p>Sets the wireless network name. SSID stands for Service Set Identifier. All stations must be configured with the correct SSID to access the WLAN. If the SSID does not match, that user will not be granted access.</p> <p>The naming conventions are: Minimum is one character and maximum number of characters: 32 bytes.</p>
BSSID	The BSSID is a 48bit identity used to identify a particular BSS (Basic Service Set) within an area. In Infrastructure BSS networks, the BSSID is the MAC (Medium Access Control) address of the AP (Access Point) and in Independent BSS or ad hoc networks, the BSSID is generated randomly.
Country	<p>A drop-down menu that permits worldwide and specific national settings. Each country listed in the menu enforces specific regulations limiting channel range:</p> <ul style="list-style-type: none"> ● US= worldwide ● Japan=1-14 ● Jordan= 10-13 ● Israel= 1-13
Enable Guest SSID	CT-6373 supports multiple SSIDs. Guest SSID is not visible. The wireless hosts are able to scan main SSID only.

Guest SSID	The BSSID is a 48bit identity used to identify a particular BSS (Basic Service Set) within an area. In Infrastructure BSS networks, the BSSID is the MAC (Medium Access Control) address of the AP (Access Point) and in Independent BSS or ad hoc networks, the BSSID is generated randomly.
------------	---

7.1.1 Security

Security options include authentication and encryption services based on the wired equivalent privacy (WEP) algorithm. WEP is a set of security services used to protect 802.11 networks from unauthorized access, such as eavesdropping; in this case, the capture of wireless network traffic. When data encryption is enabled, secret shared encryption keys are generated and used by the source station and the destination station to alter frame bits, thus avoiding disclosure to eavesdroppers.

802.11 supports two subtypes of network authentication services: open system and shared key. Under open system authentication, any wireless station can request authentication. The system that needs to authenticate with another wireless station sends an authentication management frame that contains the identity of the sending station. The receiving station then sends back a frame that indicates whether it recognizes the identity of the sending station.

Under shared key authentication, each wireless station is assumed to have received a secret shared key over a secure channel that is independent from 802.11 wireless network communications channel.

The following screen appears when Security is selected. The Security page allows you to configure security features of the wireless LAN interface. You can set the network authentication method, selecting data encryption, specify whether a network key is required to authenticate to this wireless network and specify the encryption strength.

Click **Apply** to configure the wireless security options.

Wireless -- Security

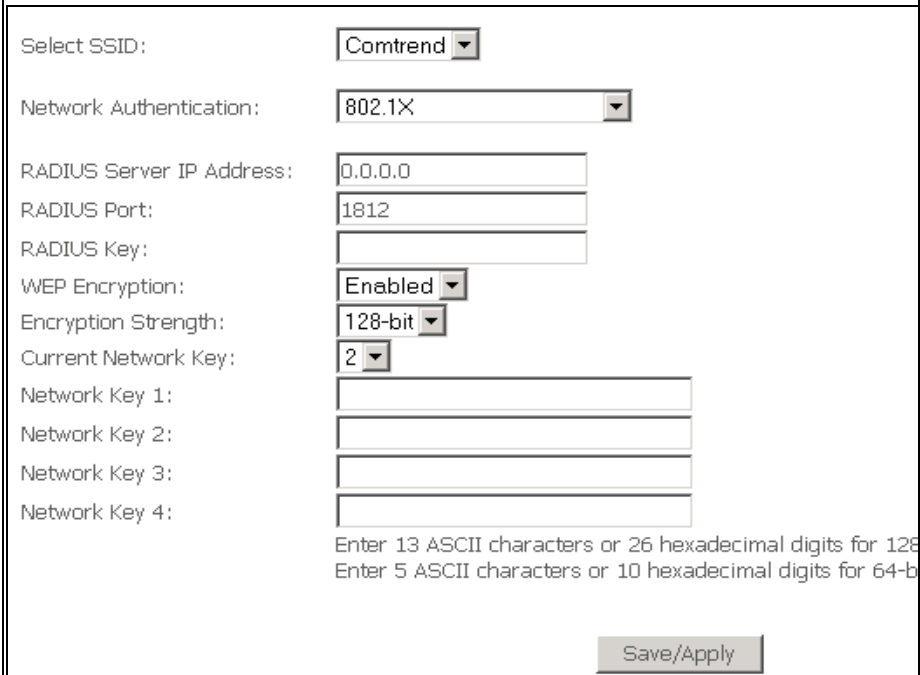

This page allows you to configure security features of the wireless LAN interface. You can sets the network authentication method, selecting data encryption, specify whether a network key is required to authenticate to this wireless network and specify the encryption strength. Click "Apply" to configure the wireless security options.

Select SSID:

Network Authentication:

WEP Encryption:

Option	Description
Select SSID	<p>Sets the wireless network name. SSID stands for Service Set Identifier. All stations must be configured with the correct SSID to access the WLAN. If the SSID does not match, that user will not be granted access.</p> <p>The naming conventions are: Minimum is one character and maximum number of characters: 32 bytes.</p>

<p>Network Authentication</p>	<p>It specifies the network authentication. When this checkbox is selected, it specifies that a network key be used for authentication to the wireless network. If the Network Authentication (Shared mode) checkbox is not shared (that is, if open system authentication is used), no authentication is provided. Open system authentication only performs identity verifications.</p> <p>Different authentication type pops up different settings requests.</p> <p>Choosing 802.1X, enter RADIUS Server IP address, RADIUS Port, and RADIUS key.</p> <p>Also, enable WEP Encryption and the Encryption Strength.</p> <div data-bbox="448 835 1372 1507">  </div> <p>Select the Current Network Key and enter 13 ASCII characters or 26 hexadecimal digits for 128-bit encryption keys and enter 5 ASCII characters or 10 hexadecimal digits for 64-bit encryption keys.</p> <p>Choosing WPA, you must enter WPA Group Rekey Interval.</p>
-------------------------------	---

	<div data-bbox="448 181 1370 667"> <p>Select SSID: Comtrend</p> <p>Network Authentication: WPA</p> <p>WPA Group Rekey Interval: <input type="text" value="0"/></p> <p>RADIUS Server IP Address: <input type="text" value="0.0.0.0"/></p> <p>RADIUS Port: <input type="text" value="1812"/></p> <p>RADIUS Key: <input type="text"/></p> <p>WPA Encryption: TKIP</p> <p>WEP Encryption: Disabled</p> <p>Save/Apply</p> </div> <p>Choosing WPA-PSK, you must enter WPA Pre-Shared Key and Group Rekey Interval.</p> <div data-bbox="448 786 1370 1176"> <p>Select SSID: Comtrend</p> <p>Network Authentication: WPA-PSK</p> <p>WPA Pre-Shared Key: <input type="text"/> Click here to display</p> <p>WPA Group Rekey Interval: <input type="text" value="0"/></p> <p>WPA Encryption: TKIP</p> <p>WEP Encryption: Disabled</p> <p>Save/Apply</p> </div>
WEP Encryption	<p>It specifies that a network key is used to encrypt the data is sent over the network. When this checkbox is selected, it enables data encryption and prompts the Encryption Strength drop-down menu. Data Encryption (WEP Enabled) and Network Authentication use the same key.</p>
Encryption strength	<p>A session's key strength is proportional to the number of binary bits comprising the session key file. This means that session keys with a greater number of bits have a greater degree of security, and are considerably more difficult to forcibly decode. This drop-down menu sets either a 64 8-bit (5-ASCII character or 10-hexadecimal character) or 128 8-bit (13-ASCII character or 26-hexadecimal character) key.</p> <p>If you set a minimum 128-bit key strength, users attempting to establish a secure communications channel with your server must use a browser capable of communicating with a 128-bit session key. The Encryption Strength settings do not display unless the network Authentication (shared Mode) check box is selected.</p>

7.1.2 MAC Filter

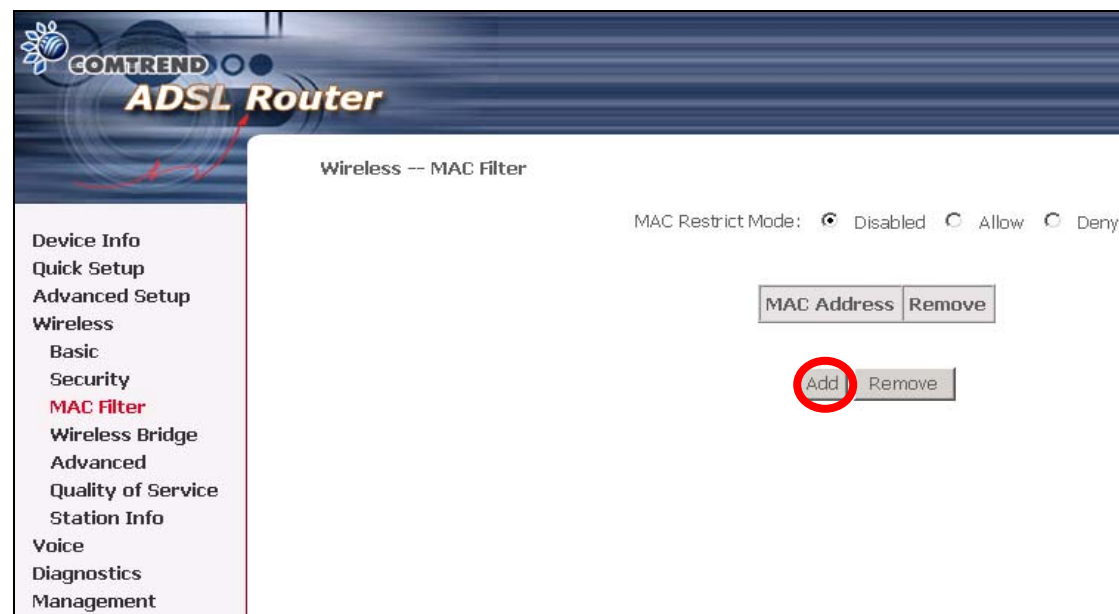

This MAC Filter page allows access to be restricted/allowed based on a MAC address. All NICs have a unique 48-bit MAC address burned into the ROM chip on the card. When MAC address filtering is enabled, you are restricting the NICs that are allowed to connect to your access point. Therefore, an access point will grant access to any computer that is using a NIC whose MAC address is on its “allows” list.

Wi-Fi Routers and access points that support MAC filtering let you specify a list of MAC addresses that may connect to the access point, and thus dictate what devices are authorized to access the wireless network. When a device is using MAC filtering, any address not explicitly defined will be denied access.

MAC Restrict mode: **Off**- disables MAC filtering; **Allow** – permits **access** for the specified MAC address; **deny**; reject access of the specified MAC address, then click the **SET** button.

To delete an entry, select the entry at the bottom of the screen and then click the **Remove** button, located on the right hand side of the screen.

To add a MAC entry, click **Add** and enter MAC address

After choosing the Add button, the following screen appears. Enter the MAC address and click **Apply** to add the MAC address to the wireless MAC address filters.

Wireless -- MAC Filter

Enter the MAC address and click "Apply" to add the MAC address to the wireless MAC address filters.

Option	Description
MAC Restrict Mode	Radio buttons that allow settings of; Disabled: MAC filtering function is disabled. Allow: Permits PCs with listed MAC addresses to connect to the access point. Deny: Prevents PCs with listed MAC from connecting to the access point.
MAC Address	Lists the MAC addresses subject to the Off, Allow, or Deny instruction. The Add button prompts an entry field that requires you type in a MAC address in a two-character, 6-byte convention: xx:xx:xx:xx:xx:xx where xx are hexadecimal numbers. The maximum number of MAC addresses that can be added is 60.

7.1.3 Wireless Bridge

This page allows you to configure wireless bridge features of the wireless LAN interface. You can select Wireless Bridge (also known as Wireless Distribution System) to disable access point functionality. Selecting Access Point enables access point functionality. Wireless bridge functionality will still be available and wireless stations will be able to associate to the AP. Select Disabled in Bridge Restrict, which disables wireless bridge restriction. Any wireless bridge will be granted access. Selecting Enabled or Enabled (Scan) enables wireless bridge restriction. Only those bridges selected in Remote Bridges will be granted access.

COMTREND ADSL Router

Wireless -- Bridge

This page allows you to configure wireless bridge features of the wireless LAN interface. You can select Wireless Bridge (also known as Wireless Distribution System) to disable access point functionality. Selecting Access Point enables access point functionality. Wireless bridge functionality will still be available and wireless stations will be able to associate to the AP. Select Disabled in Bridge Restrict which disables wireless bridge restriction. Any wireless bridge will be granted access. Selecting Enabled or Enabled(Scan) enables wireless bridge restriction. Only those bridges selected in Remote Bridges will be granted access. Click "Refresh" to update the remote bridges. Wait for few seconds to update. Click "Save/Apply" to configure the wireless bridge options.

AP Mode:

Bridge Restrict:

Option	Description
AP Mode	Access Point Wireless Bridge
Bridge Restrict	Enabled Enabled (Scan) Disabled

7.1.4 Advanced

The Advanced page allows you to configure advanced features of the wireless LAN interface.

You can select a particular channel on which to operate, force the transmission rate to a particular speed, set the fragmentation threshold, set the RTS threshold, set the wakeup interval for clients in power-save mode, set the beacon interval for the access point, set XPress mode and set whether short or long preambles are used.

Click **Apply** to configure the advanced wireless options.

The screenshot shows the 'Wireless -- Advanced' configuration page of a COMTREND ADSL Router. The left sidebar contains a navigation menu with options: Device Info, Quick Setup, Advanced Setup, Wireless, Basic, Security, MAC Filter, Wireless Bridge, Advanced (highlighted in red), Quality of Service, Station Info, Voice, Diagnostics, and Management. The main content area is titled 'Wireless -- Advanced' and includes a descriptive paragraph: 'This page allows you to configure advanced features of the wireless LAN interface. You can select a particular channel on which to operate, force the transmission rate to a particular speed, set the fragmentation threshold, set the RTS threshold, set the wakeup interval for clients in power-save mode, set the beacon interval for the access point, set XPress mode and set whether short or long preambles are used. Click "Apply" to configure the advanced wireless options.' Below this, various settings are listed with their current values: AP Isolation (Off), Band (2.4GHz), Channel (11, with 'Current: 11' noted), Auto Channel Timer (0), 54g Rate (Auto), Multicast Rate (Auto), Basic Rate (Default), Fragmentation Threshold (2346), RTS Threshold (2347), DTIM Interval (1), Beacon Interval (100), Maximum Associated Clients (128), XPress Technology (Disabled), 54g Mode (54g Auto), 54g Protection (Auto), Preamble Type (long), and Transmit Power (100%). A 'Save/Apply' button is located at the bottom right of the configuration area.

Option	Description
AP Isolation	Select On or Off. By enabling this feature, wireless clients associated with the Access Point will be able to connect to each other.

Band	The new amendment allows IEEE 802.11g units to fall back to speeds of 11 Mbps, so IEEE 802.11b and IEEE 802.11g devices can coexist in the same network. The two standards apply to the 2.4 GHz frequency band. IEEE 802.11g creates data-rate parity at 2.4 GHz with the IEEE 802.11a standard, which has a 54 Mbps rate at 5 GHz. (IEEE 802.11a has other differences compared to IEEE 802.11b or g, such as offering more channels.)
Channel	Drop-down menu that allows selection of a specific channel.
Auto Channel Timer (min)	Auto channel scan timer in minutes (0 to disable)
54g Rate	Drop-down menu that specifies the following fixed rates: Auto: Default. Uses the 11 Mbps data rate when possible but drops to lower rates when necessary. 1 Mbps, 2Mbps, 5.5Mbps, or 11Mbps fixed rates. The appropriate setting is dependent on signal strength.
Multicast Rate	Setting multicast packet transmit rate.
Basic Rate	Setting basic transmit rate.
Fragmentation Threshold	A threshold, specified in bytes, that determines whether packets will be fragmented and at what size. On an 802.11 WLAN, packets that exceed the fragmentation threshold are fragmented, i.e., split into, smaller units suitable for the circuit size. Packets smaller than the specified fragmentation threshold value are not fragmented. Enter a value between 256 and 2346. If you experience a high packet error rate, try to slightly increase your Fragmentation Threshold. The value should remain at its default setting of 2346. Setting the Fragmentation Threshold too low may result in poor performance.
RTS Threshold	Request to Send, when set in bytes, specifies the packet size beyond which the WLAN Card invokes its RTS/CTS mechanism. Packets that exceed the specified RTS threshold trigger the RTS/CTS mechanism. The NIC transmits smaller packet without using RTS/CTS. The default setting of 2347 (maximum length) disables RTS Threshold.

DTIM Interval	Delivery Traffic Indication Message (DTIM), also known as Beacon Rate. The entry range is a value between 1 and 65535. A DTIM is a countdown informing clients of the next window for listening to broadcast and multicast messages. When the AP has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. AP Clients hear the beacons and awaken to receive the broadcast and multicast messages. The default is 1.
Beacon Interval	The amount of time between beacon transmissions. Each beacon transmission identifies the presence of an access point. By default, radio NICs passively scan all RF channels and listen for beacons coming from access points to find a suitable access point. Before a station enters power save mode, the station needs the beacon interval to know when to wake up to receive the beacon (and learn whether there are buffered frames at the access point). The entered value is represented in ms. Default is 100. Acceptable entry range is 1 to 0xffff (65535)
Maximum Associated Clients	The maximum number of clients that can join this Access Point.
Xpress™ Technology	Xpress Technology is compliant with draft specifications of two planned wireless industry standards.
54g™ Mode	Set the mode to 54g Auto for the widest compatibility. Select the mode to 54g Performance for the fastest performance among 54g certified equipment. Set the mode to 54g LRS if you are experiencing difficulty with legacy 802.11b equipment.
54g Protection	In Auto mode the Router will use RTS/CTS to improve 802.11g performance in mixed 802.11g/802.11b networks. Turn protection off to maximize 802.11g throughput under most conditions.

Preamble Type	<p>Short preamble is intended for application where maximum throughput is desired but it doesn't cooperate with the legacy.</p> <p>Long preamble interoperates with the current 1 and 2 Mbit/s DSSS specification as described in IEEE Std 802.11-1999</p>
Transmit Power	The Router will set different power output (by percentage) according to this selection.

7.1.5 Quality of Service

WMM provides advanced quality of service (QoS) features for Wi-Fi networks to improve the end-user experience by prioritizing audio, video and voice traffic and optimizing the way shared network resources are allocated among competing applications.

The screenshot shows the web interface of a COMTREND ADSL Router. The header features the COMTREND logo and the text 'ADSL Router'. On the left is a navigation menu with the following items: Device Info, Quick Setup, Advanced Setup, Wireless, Basic, Security, MAC Filter, Wireless Bridge, Advanced, Quality of Service (highlighted in red), Station Info, Voice, Diagnostics, and Management. The main content area is titled 'WMM(Wi-Fi Multimedia) Settings'. It contains two settings: 'WMM(Wi-Fi Multimedia):' and 'WMM No Acknowledgement:', both with a dropdown menu set to 'Disabled'. A 'Save/Apply WME Settings' button is located at the bottom right of the settings area.

If you want to enable Click on the drop down menu and select, then click the **Save/Apply WME Settings** button.

7.1.6 Station Info

This page shows authenticated wireless stations and their status.

Wireless -- Authenticated Stations

This page shows authenticated wireless stations and their status.

BSSID	Associated	Authorized
00:12:F0:B5:C9:9C		

Refresh

BSSID	The BSSID is a 48bit identity used to identify a particular BSS (Basic Service Set) within an area. In Infrastructure BSS networks, the BSSID is the MAC (Medium Access Control) address of the AP (Access Point) and in Independent BSS or ad hoc networks, the BSSID is generated randomly.
Associated	Lists all the stations that are associated with the Access Point, along with the amount of time since packets were transferred to and from each station. If a station is idle for too long, it is removed from this list.
Authorized	Lists those devices with authorized access.

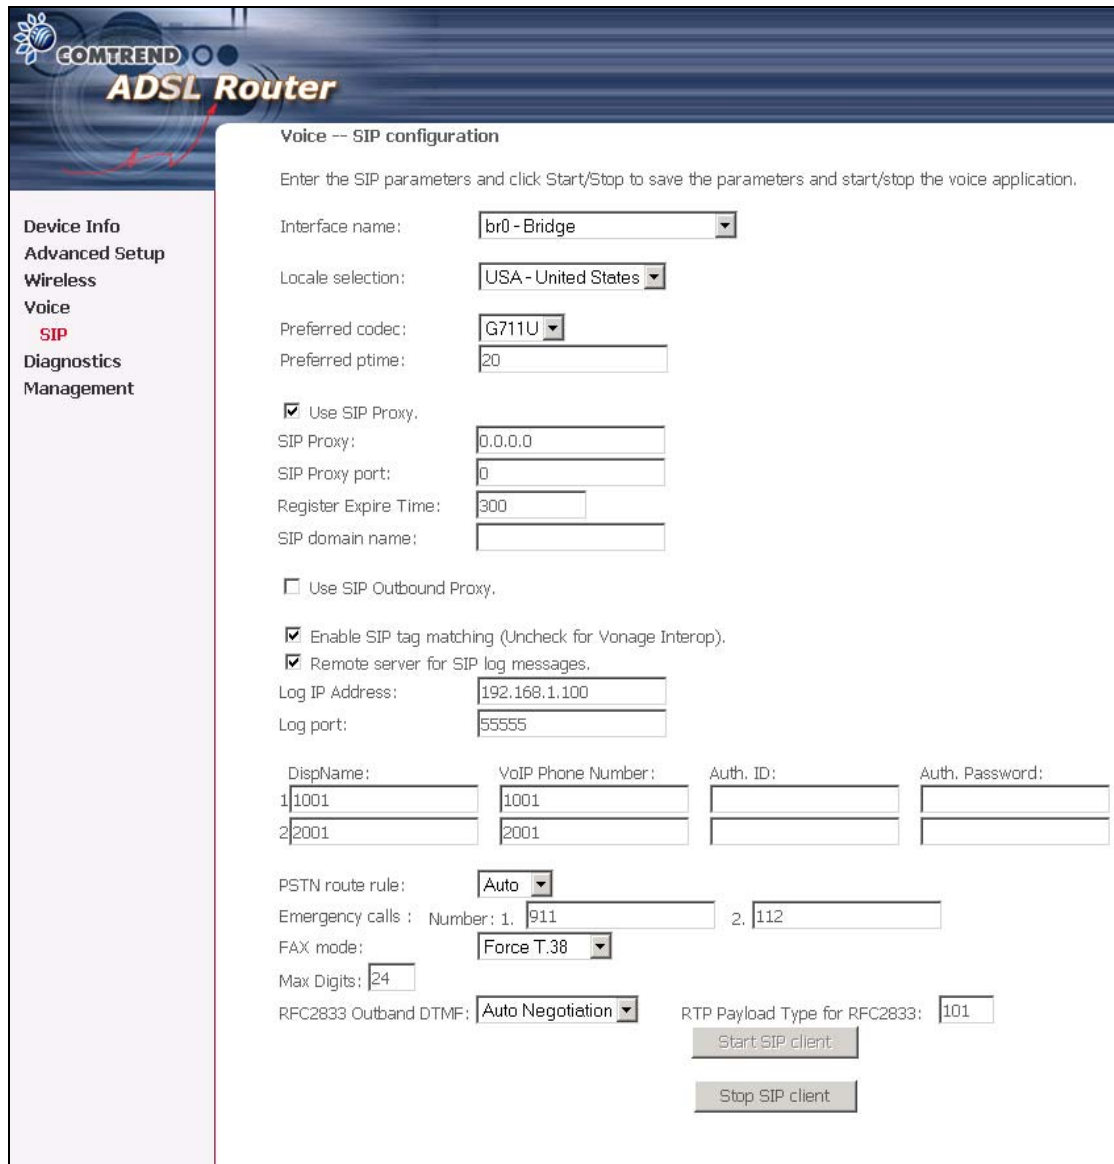

Chapter 8 Voice

SIP, the Session Initiation Protocol, is a signaling protocol for Internet conferencing, telephony, presence, events notification and instant messaging. It is the Internet Engineering Task Force's (IETF's) standard for multimedia conferencing over IP. It is designed to address the functions of signaling and session management within a packet telephony network. Signaling allows call information to be carried across network boundaries. Session management provides the ability to control the attributes of an end-to-end call.

Session Initiation Protocol is a peer-to-peer protocol. There are four components in SIP standard, (a) User Agent (UA), (b) Proxy Server, (c) Registrar Server, and, (d) Redirect Server. This particular document describes about SIP User Agent and the call establishment between User Agents.

To access SIP, Simply click on the Voice->**SIP** from main menu. The following screen will be displayed.

8.1 SIP

COMTREND ADSL Router

Voice -- SIP configuration

Enter the SIP parameters and click Start/Stop to save the parameters and start/stop the voice application.

Interface name:

Locale selection:

Preferred codec:

Preferred ptime:

☒ Use SIP Proxy.

SIP Proxy:

SIP Proxy port:

Register Expire Time:

SIP domain name:

☐ Use SIP Outbound Proxy.

☒ Enable SIP tag matching (Uncheck for Vonage Interop).

☒ Remote server for SIP log messages.

Log IP Address:

Log port:

DispName:	VoIP Phone Number:	Auth. ID:	Auth. Password:
1 1001	1001		
2 2001	2001		

PSTN route rule:

Emergency calls : Number: 1. 2.

FAX mode:

Max Digits:

RFC2833 Outband DTMF:

RTP Payload Type for RFC2833:

Once the settings are configured click **Stop SIP client** to stop the VoIP service and to start click **Start SIP client** to run the new configuration.

Interface name	WAN interface name
Local Selection	Set tone, ring type and physical characteristics for each specific country.
Preferred codec	The preferred codec of this user. The default is G.711U first.

Preferred ptime	The preferred ptime of this user. The default is 20.
Use SIP proxy	<p>A proxy is an intermediary program that acts as both a server and a client for the purpose of making requests on behalf of other clients. Requests are serviced internally or transferred to other servers. A proxy interprets and, if necessary, rewrites a request message before forwarding it.</p> <p>Input IP address or domain name of the SIP proxy server, used for VOIP service. 5060 is the default (change based on your VoIP service provider).</p>
Register Expire Time	The time period until user would like its registration to be valid with the Registrar/Proxy Server. The default value is 300 seconds.
SIP domain name*	Provided by your VoIP service provider.
Use SIP outbound proxy Enable SIP tag matching (Uncheck for Vonage Interop).	Click if required by your VoIP service provider.
Remote server for SIP log messages	Enable or disable log the SIP message to remote server.
DispName	The string for called party's telephone to display the caller name.
VoIP Phone Number	Endpoint telephone number. As the modem has two FXS, you can enter two telephone numbers for VoIP phone.
Auth. ID	The authentication user name for the Registrar/proxy, which is assigned by the service provider.
Auth. Password	The authentication password for the Registrar/proxy, which is assigned by the service provider.

PSTN route rule	<p>If PSTN route rule is "auto" , when a PSTN call coming will ring the idle phone(phone1 idle ring phone1,phone1 busy ring phone2)</p> <p>If PSTN route rule is "fix", when a PSTN call coming will ring the phone that the user selects from PSTN route data (phone1, phone2 or both)</p>
Emergency calls Number 1 & 2	Emergency phone numbers. Note that you need to change these numbers to correspond with the emergency numbers that are used in your country.
FAX mode:	Use G711u (Pass-through) or T.38 when sending a fax.
Max Digits	Setup the maximum number of digits for the phone number.
RFC2833 Outband DTMF	Enable the special use of RTP packets to transmit digit events.
RTP Payload Type for RFC2833	Payload types are defined in RFC 2833, RTP Payload for DTMF Digits, Telephony Tones and Telephony Signals. A payload type is a number from 96 to 127 that identifies the type of payload carried in the packet. The payload type should be identical on the GW and call agent.

8.1.1 Making Telephone Calls

To make a call, simply dial the number. The dial plan (i.e. the dialed digits) is normally customized for each installation. The default dial plan delivered by Comtrend allows dialing of 4-digit extensions or direct IP addresses. Shorter extension numbers (e.g. 3-digits) can be dialed by completing the dial string with a final #.

When a Call Server (SIP Proxy Server) is configured into the system, the dialed digits are translated and routed by the Call Server to the correct destination as registered with the Call Server.

If no Call Server is configured, calls can still be made using 4-digit extensions, rather than using full IP addresses. The originator translates the dialed-digits to a destination device as follows:

- First digit: line identifier (for multi-line gateways)
- Remaining digits: Host number part of an IP address. The Network number part is considered to be the same as the caller's IP address.

For example, if a caller at address 10.136.64.33/24 dials "2023", the call will be placed to the second line at address 10.136.64.23. All devices have to be on the same Class C subnet (24 bit subnet mask).

To dial an IP address directly, dial the IP address digits, using keypad * as the dot. Complete the address with a final * or #. When using IP address dialing it is not possible to specify which line at a gateway is called, so the gateway always routes IP-address dialed calls to the first line.

Network busy tone (fast busy) will be played for unknown or unreachable destinations.

To answer calls, simply pick up the phone or press the handsfree button.

Caller ID

The Call Manager delivers Calling Number when placing calls. The calling number is transmitted to the analog line for CLASS recognition.

Call Hold

To put a call on hold, press flash then hang up (optional). To return to the original call, press flash or pick up the phone. The phone will issue a short ring burst every 30 seconds or so while on-hook to remind you that a call is on hold.

Call Transfer

To transfer a call, press flash then dial the new number.

To transfer immediately, hang up (blind transfer).

To transfer with consultation, wait for the party to answer, consult, and then hang up.

To abort the transfer (if the third party does not answer), press flash to return to the original call.

Conference Calling

To turn a two-party call into a three-party conference call, press flash and dial the third party. Wait for the party to answer, then press flash.

To drop the third party and return to a two-party call, press flash again. To drop yourself out of the conference, hang up. The call will be transferred (so that the other two parties remain connected to each other). In conference mode, the conference initiator performs the audio bridge/mixing function – there are only 2 voice streams established.

Call Waiting

If call waiting is enabled on a line (see feature codes), and you hear the call waiting tone during a call, press flash to answer the second call. The first call is automatically placed on hold. To switch between calls, press flash again.

To disable the call waiting feature, dial *60.

To enable the call waiting feature, dial *61.

Call forward feature settings (Busy or All) takes priority over the call waiting feature.

Call waiting feature is ignored on new incoming calls if there is already a call on hold or in conference.

Call Forward Number

To set the call forward number, dial *74 then the number. Note that this does not actually enable forwarding; to do so, select the call forward action as described below.

To disable all call forwarding features, dial *70

Call Forward No Answer

To enable call forward on no answer, dial *71. Incoming calls will be forwarded if unanswered for 10 seconds.

Call Forward Busy

To enable call forward if busy, dial *72. Incoming calls will be immediately forwarded if the phone is off-hook.

Call Forward All

To enable call forward for all calls, dial *73.

To disable the "forward all calls" feature, dial *75. Previous settings for Call Forward Busy or No Answer are not modified.

Call Return

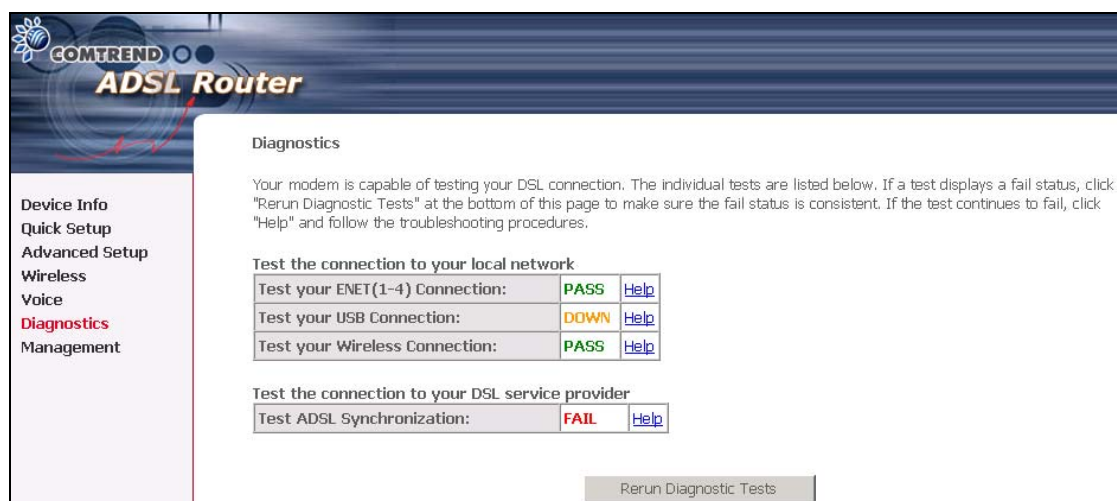

To place a call to the last known incoming caller (unanswered or not), dial *69.

Redial

To redial the last outgoing number, dial *68.

Chapter 9 Diagnostics

The Diagnostics menu provides feedback on the connection status of the CT-6373 and the ADSL link. The individual tests are listed below. If a test displays a fail status, click **Rerun Diagnostic Tests** at the bottom of this page to make sure the fail status is consistent. If the test continues to fail, click **Help** and follow the troubleshooting procedures.

Test	Description
Ethernet Connection	<p>Pass: indicates that the Ethernet interface from your computer is connected to the LAN port of your DSL Router. A blinking or solid green LAN LED on the Router also signifies that an Ethernet connection is present and that this test is successful.</p> <p>Fail: Indicates that the DSL Router does not detect the Ethernet interface on your computer.</p>
USB	This option is for future release.
ADSL Synchronization	<p>Pass: Indicates that the DSL modem has detected a DSL signal from the telephone company. A solid WAN LED on the Router also indicates the detection of a DSL signal from the telephone company.</p> <p>Fail: indicates that the DSL modem does not detect a signal from the telephone company's DSL network. The WAN LED will stop blinking (i.e. training) and the LED will switch off.</p>

pppoe_0_35_1 Diagnostics

Your modem is capable of testing your DSL connection. The individual tests are listed below. If a test displays a fail status, click "Rerun Diagnostic Tests" at the bottom of this page to make sure the fail status is consistent. If the test continues to fail, click "Help" and follow the troubleshooting procedures.

Test the connection to your local network

Test your ENET1 Connection:	PASS	Help
Test your ENET2 Connection:	FAIL	Help
Test your ENET3 Connection:	FAIL	Help
Test your ENET4 Connection:	FAIL	Help
Test your USB Connection:	DOWN	Help
Test your Wireless Connection:	PASS	Help

Test the connection to your DSL service provider

Test ADSL Synchronization:	FAIL	Help
Test ATM OAM F5 segment ping:	FAIL	Help
Test ATM OAM F5 end-to-end ping:	FAIL	Help

Test the connection to your Internet service provider

Test PPP server connection:	FAIL	Help
Test authentication with ISP:	FAIL	Help
Test the assigned IP address:	FAIL	Help
Ping default gateway:	FAIL	Help
Ping primary Domain Name Server:	PASS	Help

TestTest With OAM F4

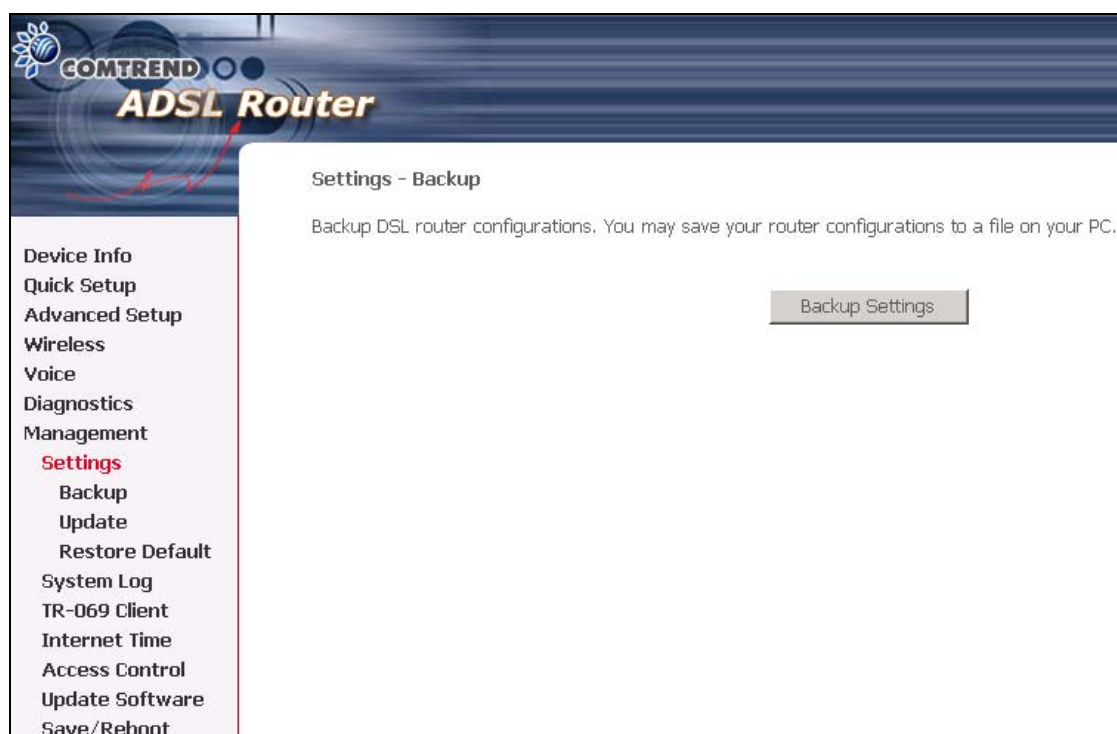

Chapter 10 Management

The Management section of the CT-6373 supports the following maintenance functions and processes:

- Settings
- System log
- TR-069 Client
- Internet Time
- Access Control
- Update software
- Save/Reboot

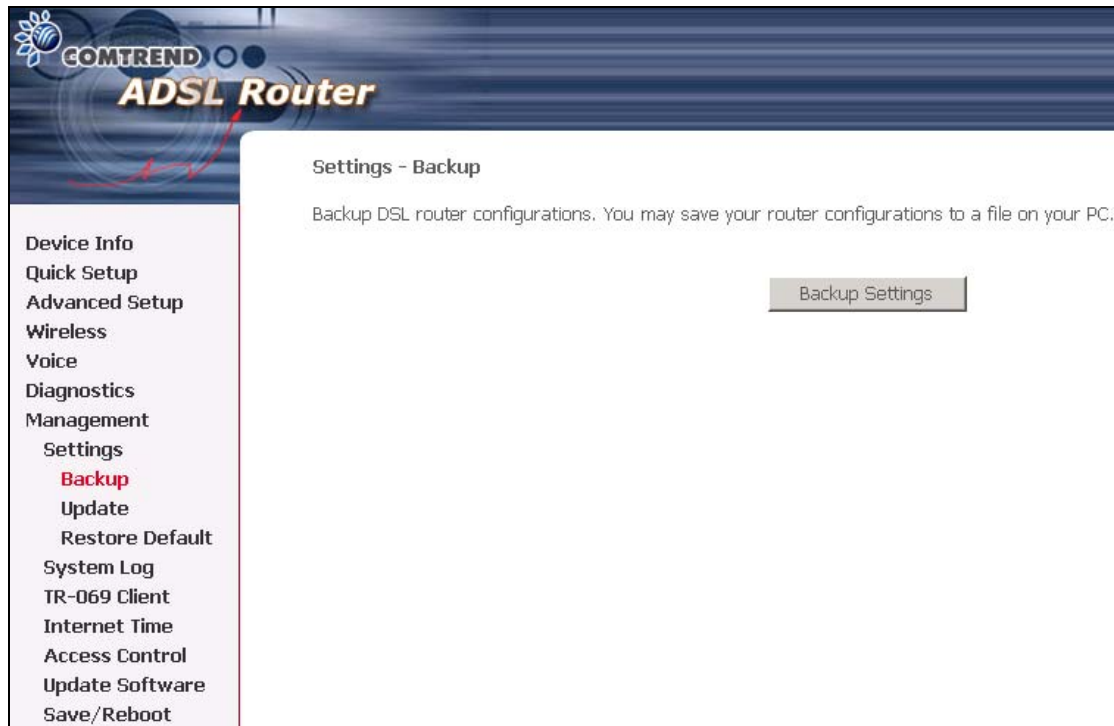

10.1 Settings

The Settings option allows you to back up your settings to a file, retrieve the setting file, and restore the settings.

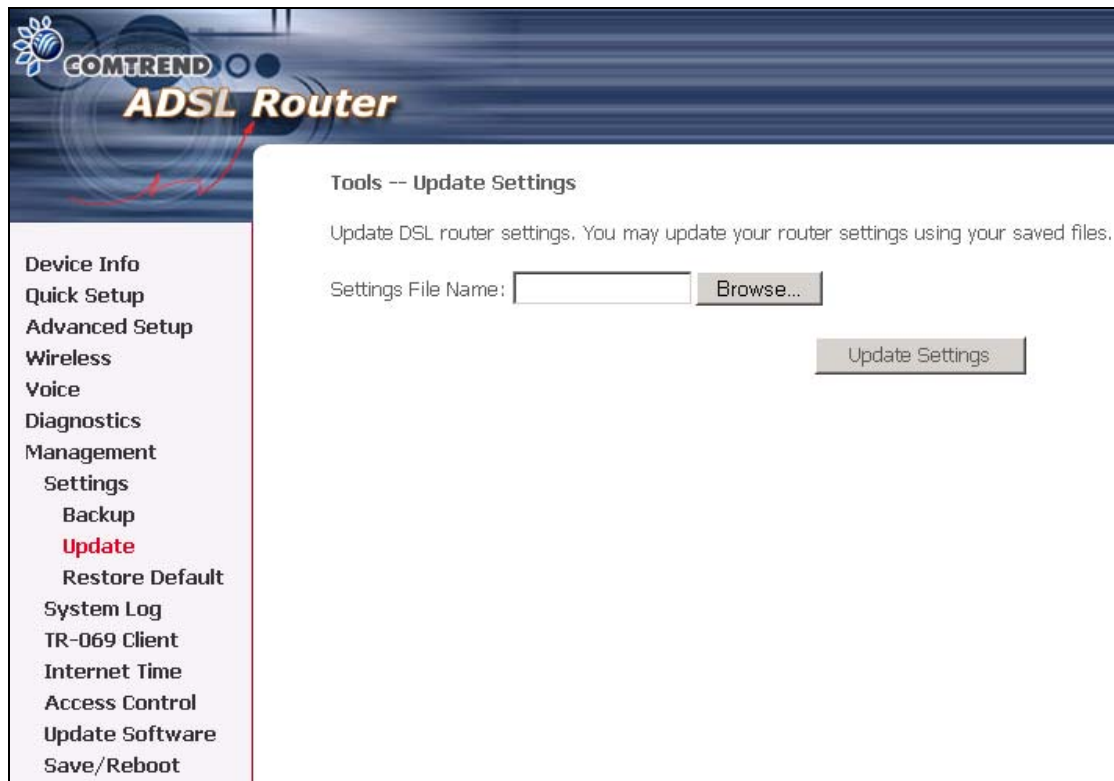

10.1.1 Configuration Backup

The Backup option under Management->Settings save your Router configurations to a file on your PC. Click BACKUP Settings in the main window. You will be prompted to define the location of the backup file to save. After choosing the file location, click **Backup Settings**. The file will then be saved to the assigned location.

10.1.2 Tools – Update Settings

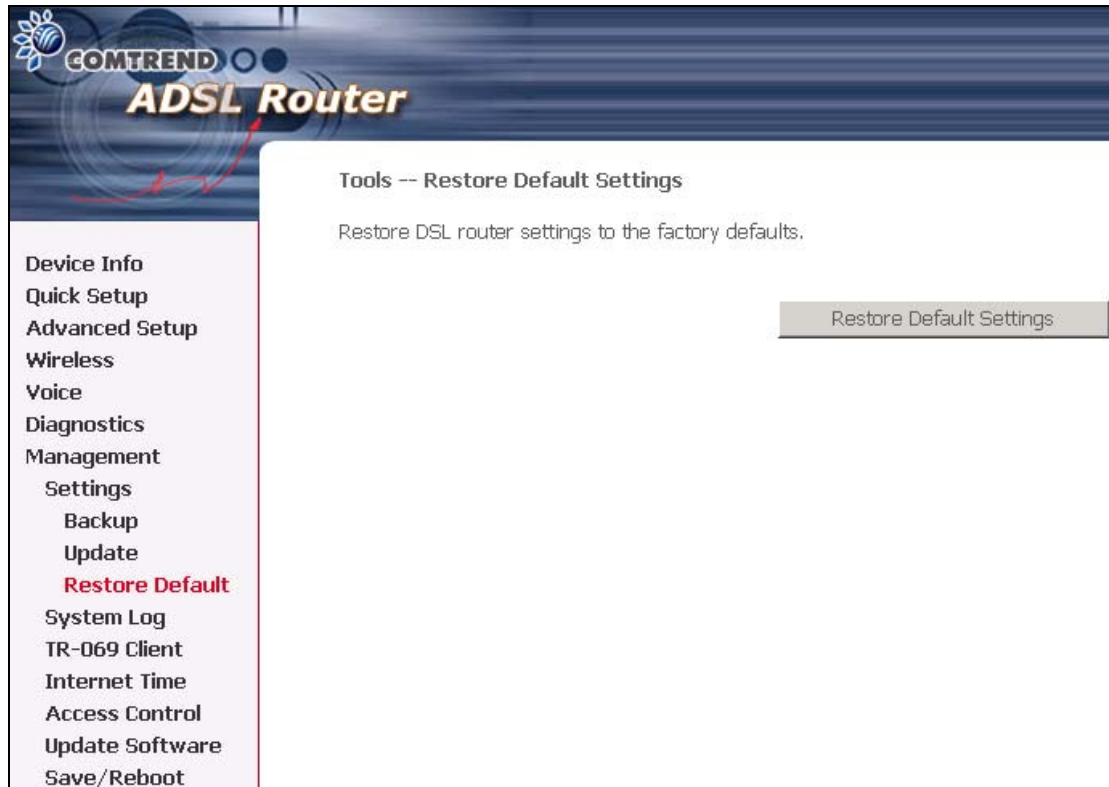

The Update option under Management->Settings update your Router settings using your saved files.

The screenshot displays the Comtrend ADSL Router web interface. The header features the Comtrend logo and the text 'ADSL Router'. A left-hand navigation menu lists various settings categories: Device Info, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, Management, Settings, Backup, Update (highlighted in red), Restore Default, System Log, TR-069 Client, Internet Time, Access Control, Update Software, and Save/Reboot. The main content area is titled 'Tools -- Update Settings' and contains the instruction: 'Update DSL router settings. You may update your router settings using your saved files.' Below this, there is a 'Settings File Name:' label followed by a text input field and a 'Browse...' button. At the bottom right of the main area is an 'Update Settings' button.

10.1.3 Restore Default

Clicking the Restore Default Configuration option in the Restore Settings screen can restore the original factory installed settings.

NOTE: This entry has the same effect as the hardware reset-to-default button. The CT-6373 board hardware and the boot loader support the **reset to default** button. If the reset button is continuously pushed for more than 5 seconds, the boot loader will erase the entire configuration data saved on the flash memory.

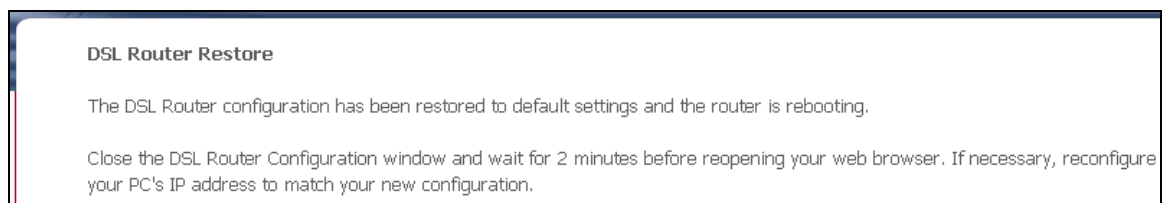

NOTE: Restoring system settings requires a system reboot. This necessitates that the current Web UI session be closed and restarted. Before restarting the connected PC must be configured with a static IP address in the 192.168.1.x subnet in order to configure the CT-6373.

Default settings

The CT-6373 default settings are

- LAN port IP= 192.168.1.1, subnet mask = 255.255.255.0
- Local user name: root
- Password: 12345
- Remote user name: support
- Remote user password: support

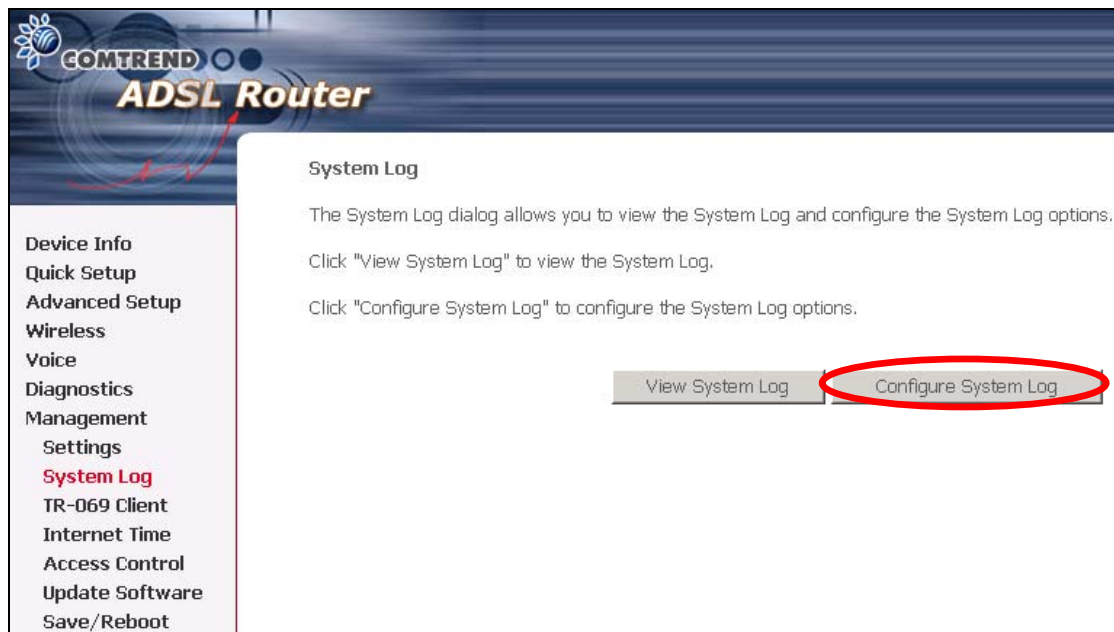

After the Restore Default Configuration button is selected, the following screen appears. Close the Multi-DSL Router Configuration window and wait for 2 minutes before reopening your web browser. If necessary, reconfigure your PC's IP address to match your new configuration.

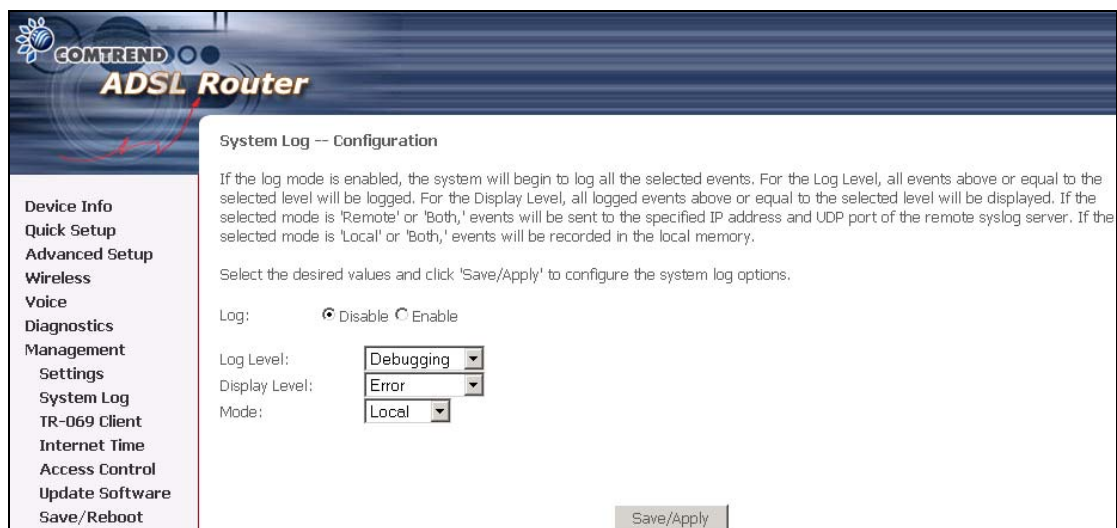

10.2 System Log

The System Log option under Management->Settings allows you to view the system events log, or to configure the System Log options. The default setting of system log is disabled. Follow the steps below to enable and view the system log.

1. Click **Configure System Log** to display the following screen.

2. Select from the desired Log options described in the following table, and then click **Save/Apply**.

Option	Description
Log	Indicates whether the system is currently recording events. The user can enable or disable event logging. By default, it is disabled. To enable it, tick Enable and then Apply button.
Log level	<p>Allows you to configure the event level and filter out unwanted events below this level. The events ranging from the highest critical level "Emergency" down to this configured level will be recorded to the log buffer on the CT-6373 SDRAM. When the log buffer is full, the newer event will wrap up to the top of the log buffer and overwrite the old event. By default, the log level is "Debugging," which is the lowest critical level. The following log levels are</p> <ul style="list-style-type: none"> ● Emergency = system is unusable ● Alert = action must be taken immediately ● Critical = critical conditions ● Error = Error conditions ● Warning = normal but significant condition ● Notice= normal but insignificant condition ● Informational= provides information for reference ● Debugging = debug-level messages <p>Emergency is the most serious event level, whereas Debugging is the least important. For instance, if the log level is set to Debugging, all the events from the lowest Debugging level to the most critical level Emergency level will be recorded. If the log level is set to Error, only Error and the level above will be logged.</p>
Display Level	Allows the user to select the logged events and displays on the View System Log page for events of this level and above to the highest Emergency level.
Mode	<p>Allows you to specify whether events should be stored in the local memory, or be sent to a remote syslog server, or both simultaneously. If remote mode is selected, view system log will not be able to display events saved in the remote syslog server.</p> <p>When either Remote mode or Both mode is configured, the WEB UI will prompt the user to enter the Server IP address and Server UDP port.</p>

3. Click **View System Log**. The results are displayed as follows.

System Log

Date/Time	Facility	Severity	Message
Jan 1 00:00:12	syslog	emerg	BCM96345 started: BusyBox v0.60.4 (2004.09.14-06:30+0000)
Jan 1 00:00:17	user	crit	klogd: USB Link UP.
Jan 1 00:00:19	user	crit	klogd: eth0 Link UP.

[Refresh](#)[Close](#)

10.3 TR-069 Client

WAN Management Protocol (TR-069) allows a Auto-Configuration Server (ACS) to perform auto-configuration, provision, collection, and diagnostics to this device.

The screenshot shows the 'TR-069 client - Configuration' page of a COMTREND ADSL Router. The left sidebar contains a menu with options: Device Info, Quick Setup, Advanced Setup, Wireless, Voice, Diagnostics, Management, Settings, System Log, TR-069 Client (highlighted in red), Internet Time, Access Control, Update Software, and Save/Reboot. The main content area has a title 'TR-069 client - Configuration' and a description: 'WAN Management Protocol (TR-069) allows a Auto-Configuration Server (ACS) to perform auto-configuration, provision, collection, and diagnostics to this device.' Below this, it says 'Select the desired values and click "Apply" to configure the TR-069 client options.' There are two radio buttons for 'Inform': 'Disable' (selected) and 'Enable'. Below these are five input fields: 'Inform Interval' (300), 'ACS URL' (empty), 'ACS User Name' (admin), 'ACS Password' (*****), and 'Connection Request User Name' (admin). The 'Connection Request Password' field is also empty. At the bottom right are two buttons: 'Save/Apply' and 'GetRPCMethods'.

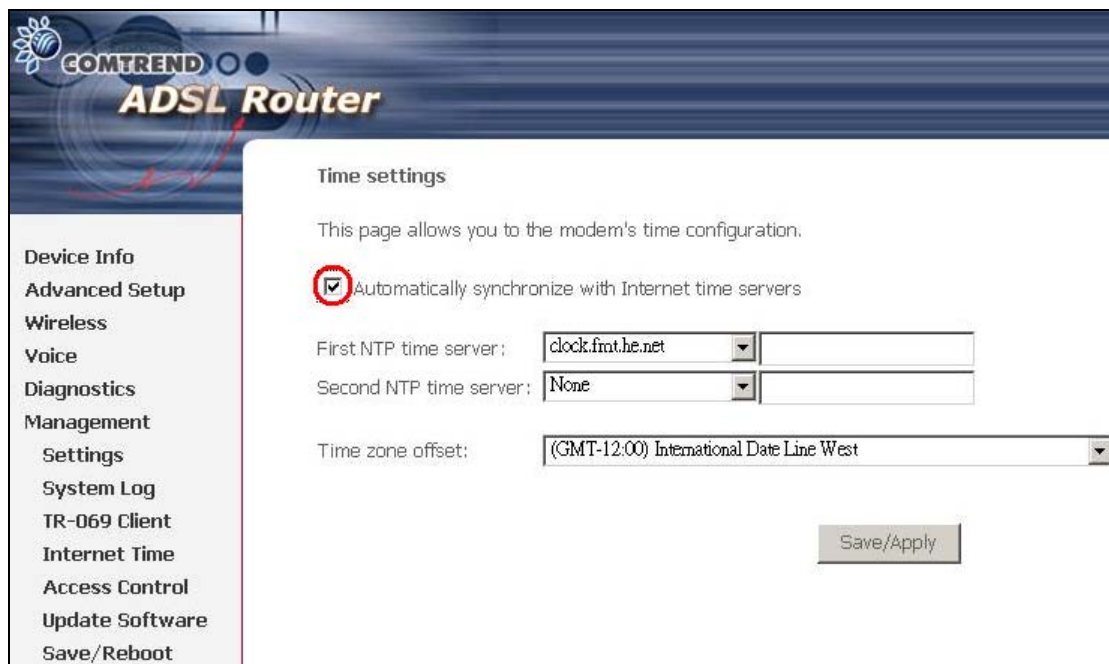

Option	Description
Inform	Disable/Enable TR-069 client on the CPE.
Inform Interval	The duration in seconds of the interval for which the CPE MUST attempt to connect with the ACS and call the Inform method.
ACS URL	URL for the CPE to connect to the ACS using the CPE WAN Management Protocol. This parameter MUST be in the form of a valid HTTP or HTTPS URL. An HTTPS URL indicates that the ACS supports SSL. The "host" portion of this URL is used by the CPE for validating the certificate from the ACS when using certificate-based authentication.
ACS User Name	Username used to authenticate the CPE when making a connection to the ACS using the CPE WAN Management Protocol. This username is used only for HTTP-based authentication of the CPE.
ACS Password	Password used to authenticate the CPE when making a connection to the ACS using the CPE WAN Management Protocol. This password is used only for HTTP-based authentication of the CPE.
Connection Request User Name	Username used to authenticate an ACS making a Connection. Request to the CPE.

Connection Request Password	Password used to authenticate an ACS making a Connection Request to the CPE.
Get RPC Methods	This method may be used by a CPE or ACS to discover the set of methods supported by the ACS or CPE it is in communication with. This list may include both standard TR-069 methods (those defined in this specification or a subsequent version) and vendor-specific methods. The receiver of the response MUST ignore any unrecognized methods. Click this button to force the CPE to immediately establish a connection to the ACS.

10.4 Internet Time

The Internet Time option under Management menu bar configures the Modem's time. To automatically synchronize with Internet time servers, tick the corresponding box displayed on the screen. Then click **Save/Apply**.

Note: This menu item will not be displayed if a Bridged PVC is configured.

The screenshot shows the 'Time settings' page of a COMTREND ADSL Router. The left sidebar contains a menu with the following items: Device Info, Advanced Setup, Wireless, Voice, Diagnostics, Management, Settings, System Log, TR-069 Client, Internet Time, Access Control, Update Software, and Save/Reboot. The 'Internet Time' option is highlighted. The main content area is titled 'Time settings' and includes the text: 'This page allows you to the modem's time configuration.' Below this, there is a checkbox labeled 'Automatically synchronize with Internet time servers' which is checked. There are two rows for NTP time servers: 'First NTP time server' with a dropdown menu showing 'clock.fimt.he.net' and an empty text field, and 'Second NTP time server' with a dropdown menu showing 'None' and an empty text field. At the bottom, there is a 'Time zone offset' dropdown menu showing '(GMT-12:00) International Date Line West'. A 'Save/Apply' button is located at the bottom right of the form.

First NTP time server: Select from the options available to synchronize with this server.

Second NTP time server: If the first time server shuts down or cannot provide the time function, operation will switch to the second time server. Select from the options available.

Time zone offset: Choose the local area (country) time zone.

10.5 Access Control

The Access Control option under Management menu bar configures the access-related parameters, including three parts: Services, IP Address, and Passwords.

The screenshot shows the Comtrend ADSL Router web interface. The left sidebar contains a menu with the following items: Device Info, Advanced Setup, Wireless, Voice, Diagnostics, Management, Settings, System Log, TR-069 Client, Internet Time, Access Control (highlighted in red), Services, IP Addresses, Passwords, Update Software, and Save/Reboot. The main content area is titled "Access Control -- Services" and includes a description: "A Service Control List ('SCL') enables or disables services from being used." Below this is a table with three columns: Services, LAN, and WAN. The table lists seven services: FTP, HTTP, ICMP, SSH, TELNET, and TFTP. Each service has checkboxes for enabling it on the LAN and WAN interfaces. The LAN checkboxes for HTTP, SSH, and TELNET are checked. A "Save/Apply" button is located at the bottom right of the table.

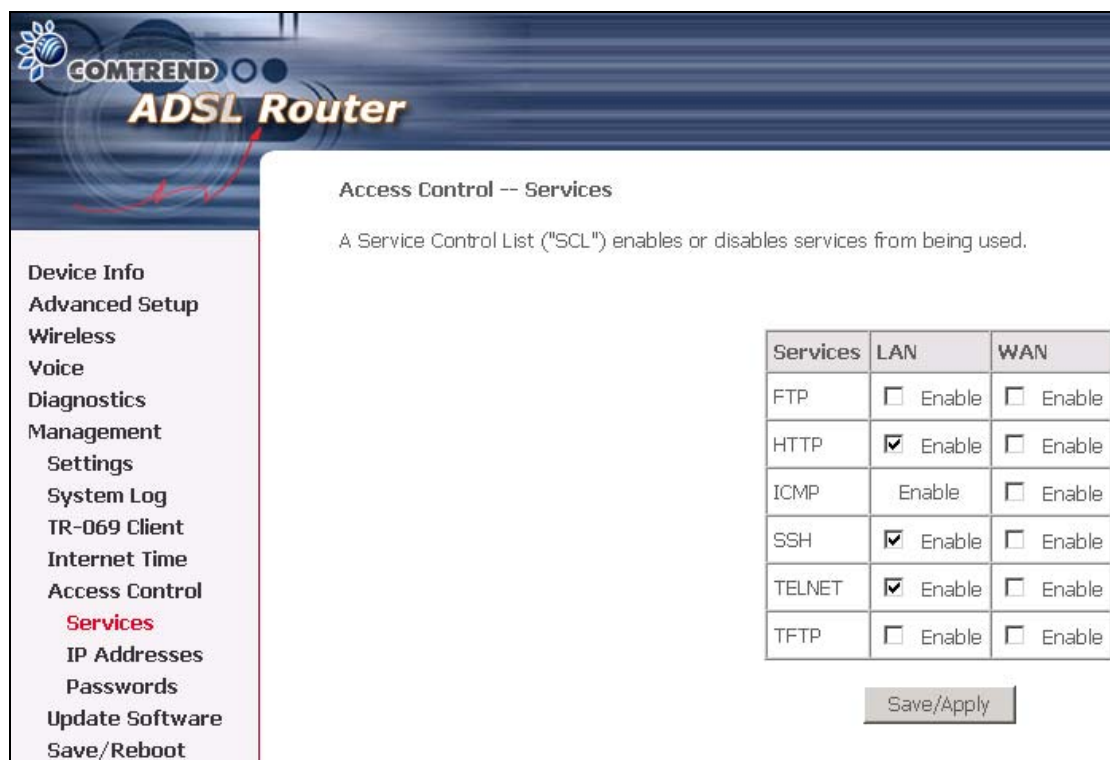

Services	LAN	WAN
FTP	<input type="checkbox"/> Enable	<input type="checkbox"/> Enable
HTTP	<input checked="" type="checkbox"/> Enable	<input type="checkbox"/> Enable
ICMP	<input type="checkbox"/> Enable	<input type="checkbox"/> Enable
SSH	<input checked="" type="checkbox"/> Enable	<input type="checkbox"/> Enable
TELNET	<input checked="" type="checkbox"/> Enable	<input type="checkbox"/> Enable
TFTP	<input type="checkbox"/> Enable	<input type="checkbox"/> Enable

Save/Apply

10.5.1 Services

The Services option limits or opens the access services over the LAN or WAN.

These services are provided FTP, HTTP, ICMP, SSH (Security Socket Share), TELNET, and TFTP. Enable the service by checking the item in the corresponding checkbox, and then click **Save/Apply**.

COMTREND ADSL Router

Access Control -- Services

A Service Control List ("SCL") enables or disables services from being used.

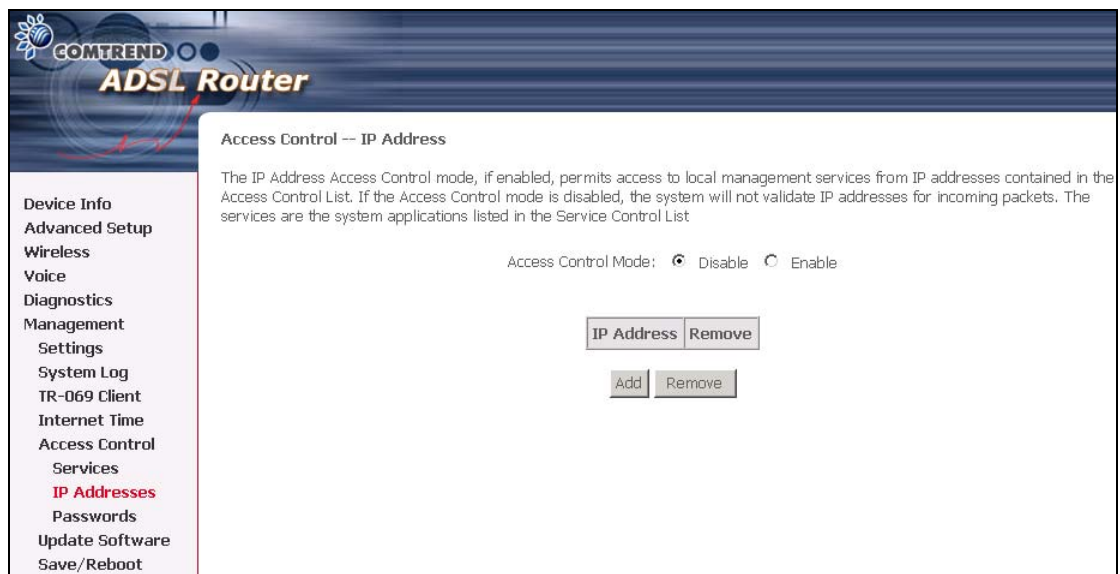

Services	LAN	WAN

10.5.2 Access IP Addresses

The IP Addresses option limits the access by IP address. If the Access Control Mode is enabled, only the allowed IP addresses can access the Router. Before you enable it, configure the IP addresses by clicking the **Add** button. Enter the IP address and click **Apply** to allow the PC with this IP address managing the Multi-DSL Router.

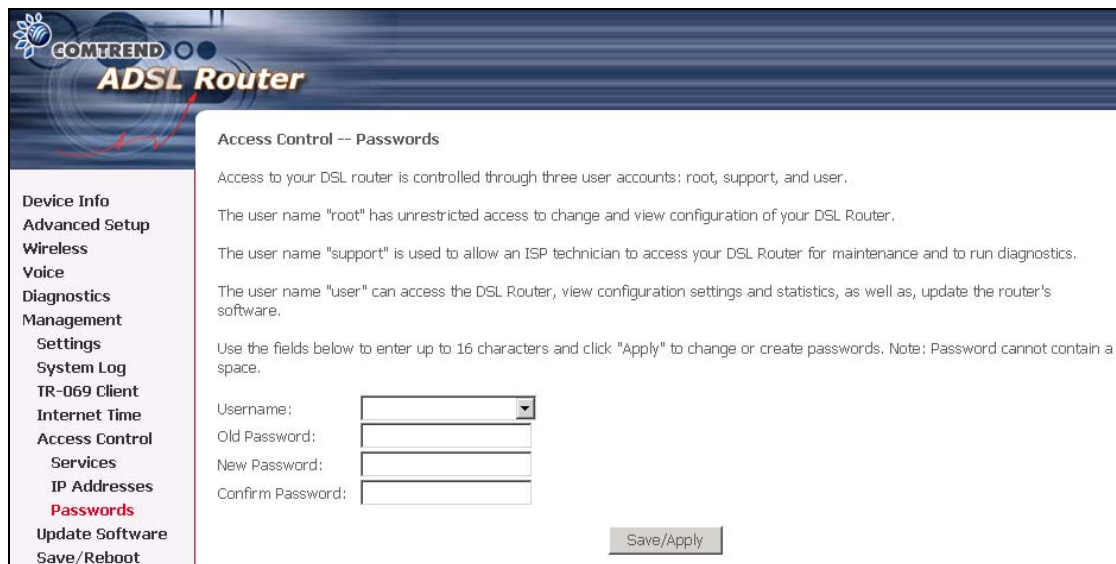

The screenshot displays the Comtrend ADSL Router web interface. The left sidebar contains a navigation menu with the following items: Device Info, Advanced Setup, Wireless, Voice, Diagnostics, Management, Settings, System Log, TR-069 Client, Internet Time, Access Control, Services, **IP Addresses** (highlighted in red), Passwords, Update Software, and Save/Reboot. The main content area is titled "Access Control -- IP Address". It includes a descriptive paragraph: "The IP Address Access Control mode, if enabled, permits access to local management services from IP addresses contained in the Access Control List. If the Access Control mode is disabled, the system will not validate IP addresses for incoming packets. The services are the system applications listed in the Service Control List". Below this text, the "Access Control Mode" is set to "Disable" with a selected radio button. There are two rows of buttons: the first row has "IP Address" and "Remove" buttons, and the second row has "Add" and "Remove" buttons.

10.5.3 Passwords

The Passwords option configures the access passwords for the Router. Access to your Multi-DSL Router is controlled through three user accounts: root, support, and user.

- "root" has unrestricted access to change and view configuration of your Multi-DSL Router.
- "support" is used to allow an ISP technician to access your Multi-DSL Router for maintenance and to run diagnostics.
- "user" can access the Router, view configuration settings and statistics, as well as, update the Router's software.

Use the fields below to enter up to 16 characters and click Apply to change or create passwords.

The screenshot shows the web interface of a COMTREND ADSL Router. The left sidebar contains a navigation menu with the following items: Device Info, Advanced Setup, Wireless, Voice, Diagnostics, Management, Settings, System Log, TR-069 Client, Internet Time, Access Control, Services, IP Addresses, Passwords (highlighted in red), Update Software, and Save/Reboot. The main content area is titled "Access Control -- Passwords". It contains the following text: "Access to your DSL router is controlled through three user accounts: root, support, and user." followed by three paragraphs explaining the roles of "root", "support", and "user". Below this is a note: "Use the fields below to enter up to 16 characters and click 'Apply' to change or create passwords. Note: Password cannot contain a space." There are four input fields: "Username:" (a dropdown menu), "Old Password:", "New Password:", and "Confirm Password:". A "Save/Apply" button is located at the bottom right of the form area.

10.6 Update software

The Update Software screen allows you to obtain an updated software image file from your ISP. Manual software upgrades from a locally stored file can be performed using the following screen.

COMTREND
ADSL Router

Device Info
Advanced Setup
Wireless
Voice
Diagnostics
Management
Settings
System Log
TR-069 Client
Internet Time
Access Control
Update Software
Save/Reboot

Tools -- Update Software

Step 1: Obtain an updated software image file from your ISP.

Step 2: Enter the path to the image file location in the box below or click the "Browse" button to locate the image file.

Step 3: Click the "Update Software" button once to upload the new image file.

NOTE: The update process takes about 2 minutes to complete, and your DSL Router will reboot.

Software File Name:

Step 1: Obtain an updated software image file from your ISP.

Step 2: Enter the path to the image file location in the box below or click the **Browse** button to locate the image file.

Step 3: Click the "Update Software" button once to upload the new image file.

NOTE: The update process takes about 2 minutes to complete, and you're Multi-DSL Router will reboot.

10.7 Save and Reboot

The Save/Reboot options saving the configurations and reboot the Router. Close the Multi-DSL Router Configuration window and wait for 2 minutes before reopening your web browser. If necessary, reconfigure your PC's IP address to match your new configuration.

Appendix A: Printer Server Configuration

1. Introduction

This application note explains the steps of enabling the Printer Server function in CT-6373 Multi-DSL Router reference platforms.

2. How to enable on-board Printer Server function

Following are the steps to enable the on-board Printer Server.

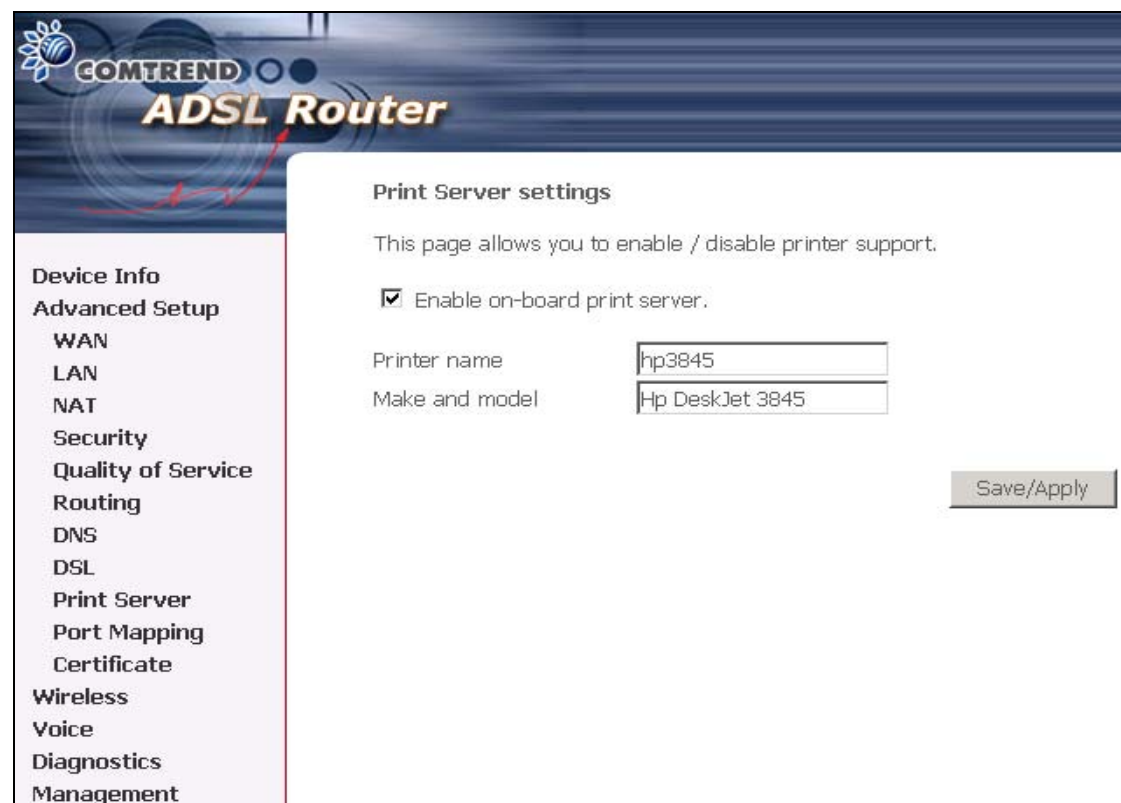

Step1: Enable Print Server from Modem Web GUI.

Check **"Enable on-board printer server"** and key in **"Printer name"**, **"Make and model"**

Note:

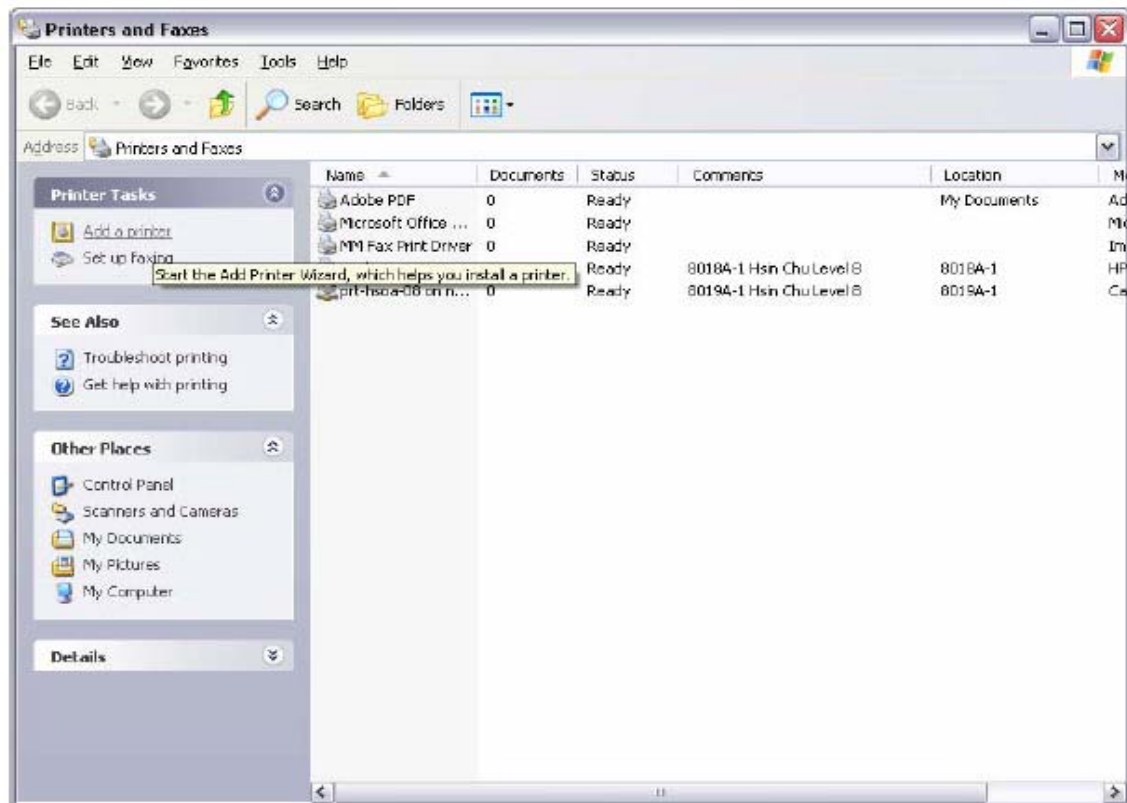

The **"Printer name"** can be any text string up to 40 characters.

The **"Make and model"** can be any text string up to 128 characters.

The screenshot displays the COMTREND ADSL Router Web GUI. On the left is a navigation menu with the following items: Device Info, Advanced Setup, WAN, LAN, NAT, Security, Quality of Service, Routing, DNS, DSL, Print Server, Port Mapping, Certificate, Wireless, Voice, Diagnostics, and Management. The 'Print Server' option is highlighted. The main content area is titled 'Print Server settings' and contains the text: 'This page allows you to enable / disable printer support.' Below this, there is a checkbox labeled 'Enable on-board print server.' which is checked. There are two text input fields: 'Printer name' with the value 'hp3845' and 'Make and model' with the value 'Hp DeskJet 3845'. A 'Save/Apply' button is located at the bottom right of the settings area.

Step2: Click on Add a printer from **Control Panel** of the **Win XP** computer and click "Next".

Step3: Select Network Printer and click "Next".

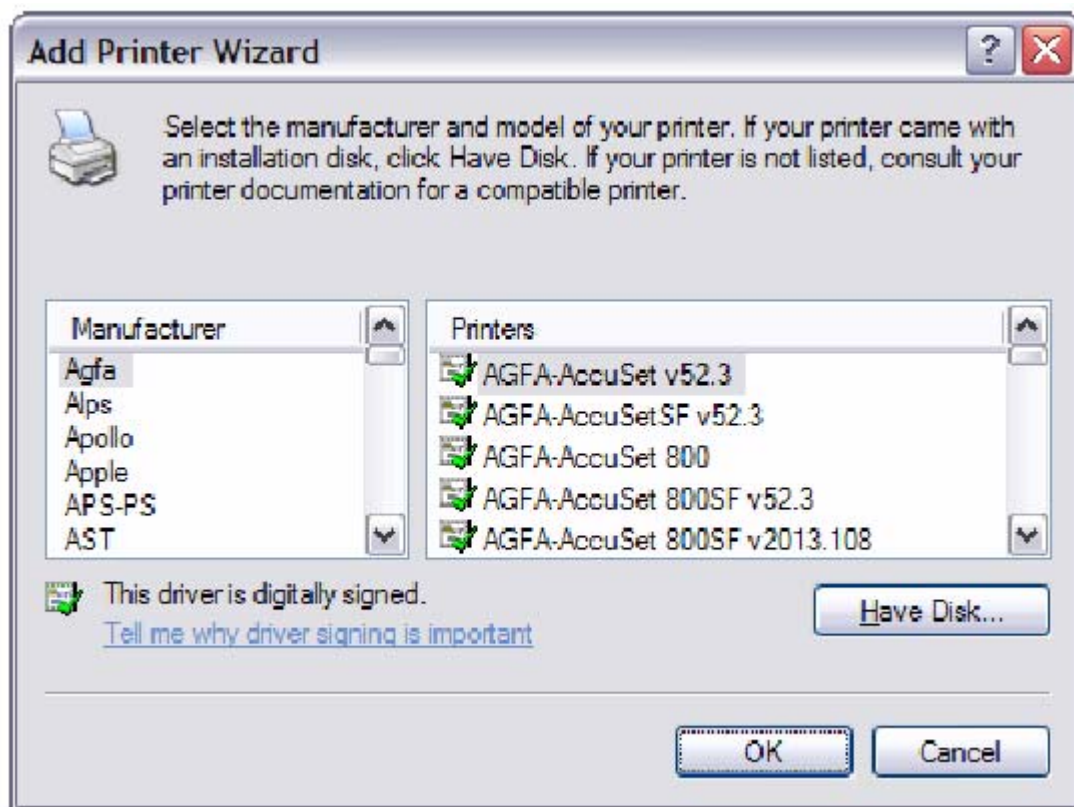

Step4: Select Connect to a printer on the Internet, type "<http://192.168.1.1:631/printers/hp3845>" and click "Next".

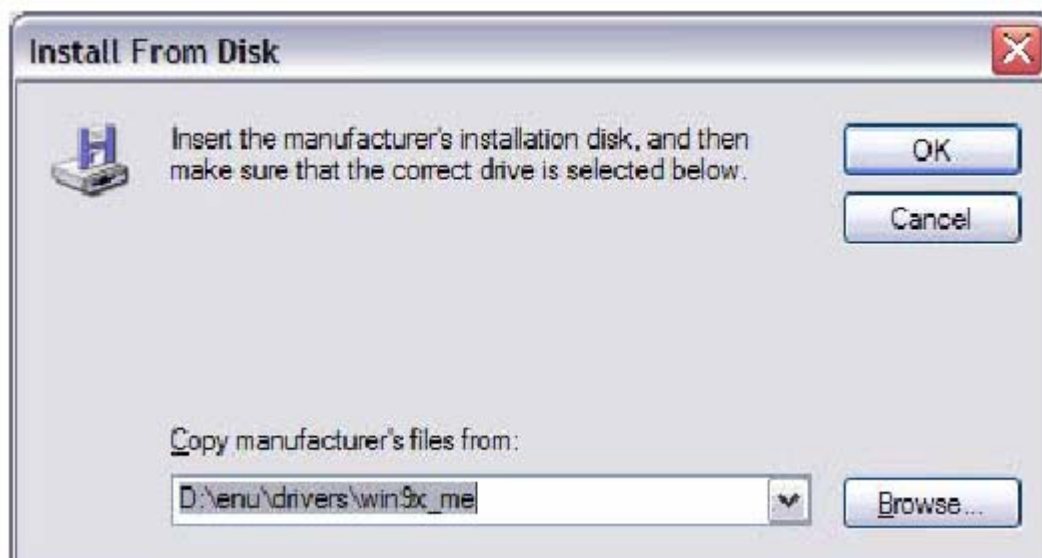

The printer name "hp3845" must be the same name entered in the ADSL modem WEB UI "printer server setting" as in step 1.

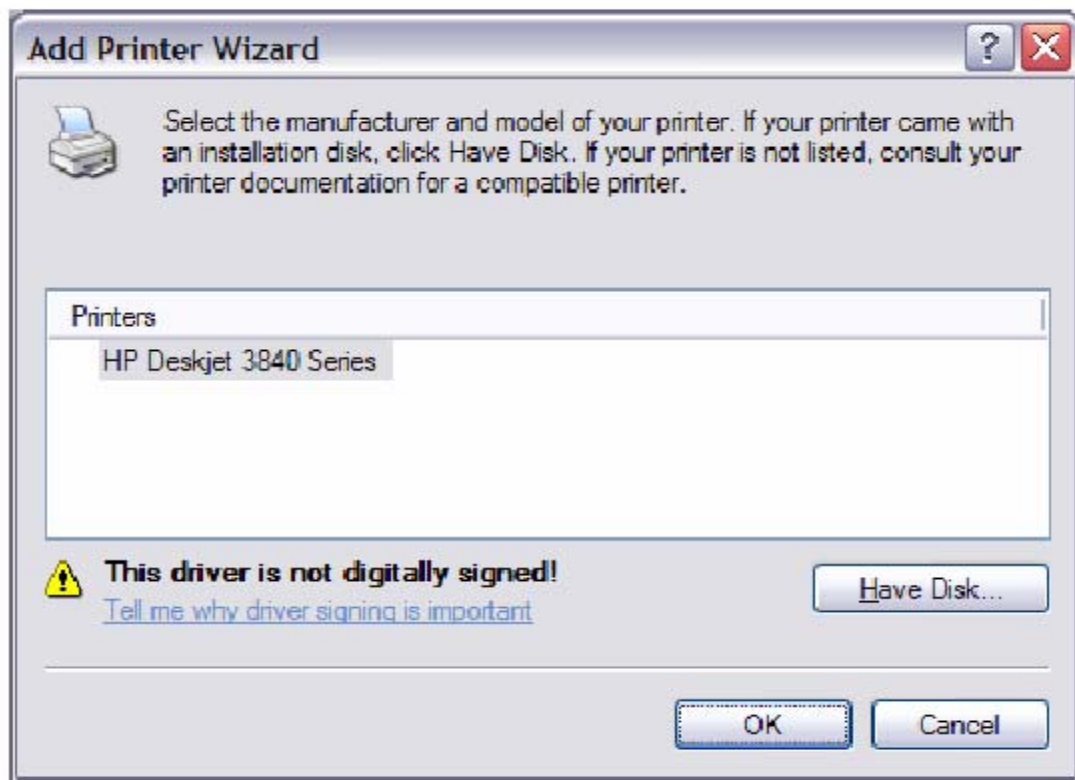

Step 5: Click "Have Disk", insert printer driver CD.

Step 6: Select driver file directory on CD-ROM and click "OK".

Step 7: Once the printer name appears, click "OK".

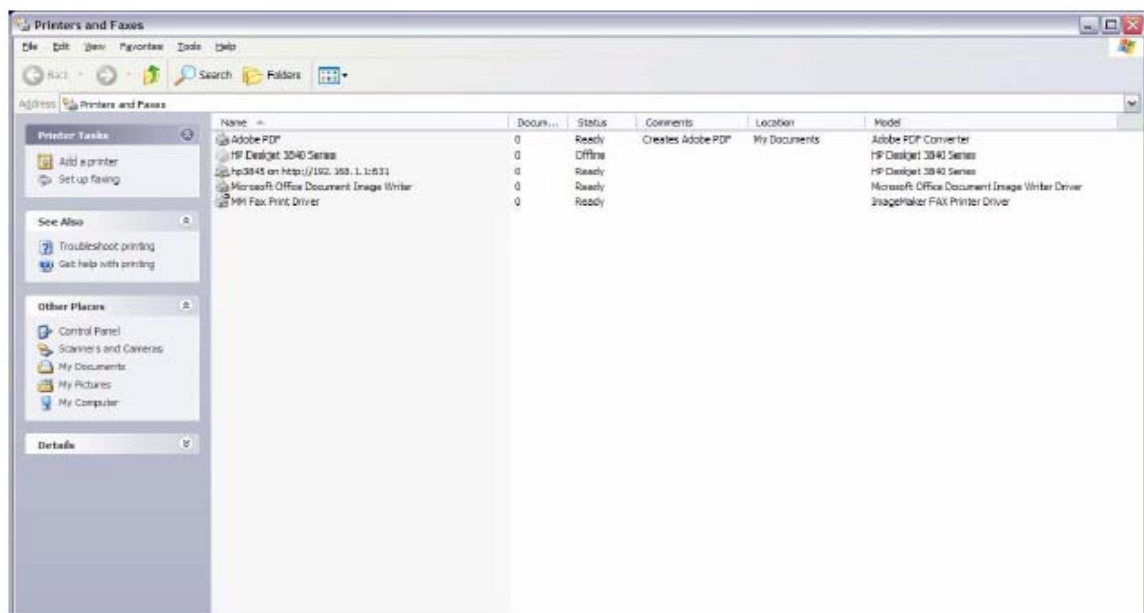

Step 8: Choose "Yes" or "No" for default printer setting and click "Next".

Step 9: Click "Finish".

Step 10: Check the status of printer from Windows Control Panel, printer window. Status should be shown ready.

Appendix B: Firewall

Stateful Packet Inspection

Refers to an architecture, where the firewall keeps track of packets on each connection traversing all its interfaces and makes sure they are valid. This is in contrast to static packet filtering which only examines a packet based on the information in the packet header.

Denial of Service attack

Is an incident in which a user or organization is deprived of the services of a resource they would normally expect to have. Various DoS attacks the device can withstand are: ARP Attack, Ping Attack, Ping of Death, Land, SYN Attack, Smurf Attack and Tear Drop.

TCP/IP/Port/Interface filtering rules

These rules help in the filtering of traffic at the Network layer i.e. Layer 3.

When a Routing interface is created "Enable Firewall" must be checked.

Navigate to Advanced Setup -> Security -> IP Filtering, web page.

Outgoing IP Filtering: Helps in setting rules to DROP packets from the LAN interface. By default if Firewall is Enabled all IP traffic from LAN is allowed. By setting up one or more filters, particular packet types coming from the LAN can be dropped.

Filter Name: User defined Filter Name.

Protocol: Can take on any values from: TCP/UDP, TCP, UDP or ICMP

Source IP Address/Source Subnet Mask: Packets with the particular "Source IP Address/Source Subnet Mask" combination will be dropped.

Source Port: This can take on either a single port number or a range of port numbers. Packets having a source port equal to this value or falling within the range of port numbers(portX : portY) will be dropped.

Destination IP Address/Destination Subnet Mask: Packets with the particular "Destination IP Address/Destination Subnet Mask" combination will be dropped.

Destination Port: This can take on either a single port number or a range of port numbers. Packets having a destination port equal to this value or falling within the range of port numbers(portX : portY) will be dropped.

Examples:

1. Filter Name : Out_Filter1
 Protocol : TCP
 Source Address : 192.168.1.45
 Source Subnet Mask : 255.255.255.0
 Source Port : 80
 Dest. Address : NA
 Dest. Sub. Mask : NA
 Dest. Port : NA

This filter will Drop all TCP packets coming from LAN with IP Address/Sub. Mask 192.168.1.45/24 having a source port of 80 irrespective of the destination. All other packets will be Accepted.

2. Filter Name : Out_Filter2
 Protocol : UDP
 Source Address : 192.168.1.45
 Source Subnet Mask : 255.255.255.0
 Source Port : 5060:6060
 Dest. Address : 172.16.13.4
 Dest. Sub. Mask : 255.255.255.0
 Dest. Port : 6060:7070

This filter will drop all UDP packets coming from LAN with IP Address/Sub.Mask 192.168.1.45/24 and a source port in the range of 5060 to 6060, destined to 172.16.13.4/24 and a destination port in the range of 6060 to 7070

Incoming IP Filtering:

Helps in setting rules to ACCEPT packets from the WAN interface. By default all incoming IP traffic from WAN is Blocked, if the Firewall is Enabled. By setting up one or more filters, particular packet types coming from the WAN can be Accepted.

Filter Name: User defined Filter Name.

Protocol: Can take on any values from: TCP/UDP, TCP, UDP or ICMP

Source IP Address/Source Subnet Mask: Packets with the particular "Source IP Address/Source Subnet Mask" combination will be accepted.

Source Port: This can take on either a single port number or a range of port numbers. Packets having a source port equal to this value or falling within the range of port numbers(portX : portY) will be accepted.

Destination IP Address/Destination Subnet Mask: Packets with the particular "Destination IP Address/Destination Subnet Mask" combination will be accepted.

Destination Port: This can take on either a single port number or a range of port numbers. Packets having a destination port equal to this value or falling within the range of port numbers(portX : portY) will be accepted.

The WAN interface on which these rules apply needs to be selected by the user.

Examples:

1. Filter Name : In_Filter1
Protocol : TCP
Source Address : 210.168.219.45
Source Subnet Mask : 255.255.0.0
Source Port : 80
Dest. Address : NA
Dest. Sub. Mask : NA
Dest. Port : NA

Selected WAN interface: mer_0_35/nas_0_35

This filter will ACCEPT all TCP packets coming from WAN interface mer_0_35/nas_0_35 with IP Address/Sub. Mask 210.168.219.45/16 having a source port of 80 irrespective of the destination. All other incoming packets on this interface are DROPPED.

2. Filter Name	: In_Filter2
Protocol	: UDP
Source Address	: 210.168.219.45
Source Subnet Mask	: 255.255.0.0
Source Port	: 5060:6060
Dest. Address	:192.168.1.45
Dest. Sub. Mask	: 255.255.255.0
Dest. Port	: 6060:7070

This rule will ACCEPT all UDP packets coming from WAN interface mer_0_35/nas_0_35 with IP Address/Sub.Mask 210.168.219.45/16 and a source port in the range of 5060 to 6060, destined to 192.168.1.45/24 and a destination port in the range of 6060 to 7070. All other incoming packets on this interface are DROPPED.

MAC Layer Filtering:

These rules help in the filtering of traffic at the Layer 2. MAC Filtering is only effective on ATM PVCs configured in Bridge mode. After a Bridge mode PVC is created, navigate to Advanced Setup -> Security -> MAC Filtering web page.

Global Policy:

When set to Forwarded the default filter behavior is to Forward all MAC layer frames except those explicitly stated in the rules. Setting it to Blocked changes the default filter behavior to Drop all MAC layer frames except those explicitly stated in the rules.

To setup a rule:

Protocol Type: Can be either PPPoE, IPv4, IPv6, AppleTalk, IPX, NetBEUI, IGMP.

Destination MAC Address: Of the form, XX:XX:XX:XX:XX:XX. Frames with this particular destination address will be Forwarded/Dropped depending on whether the Global Policy is Blocked/Forwarded.

Source MAC Address: Of the form, XX:XX:XX:XX:XX:XX. Frames with this particular source address will be Forwarded/Dropped depending on whether the Global Policy is Blocked/Forwarded.

Frame Direction:

LAN <=> WAN --> All Frames coming/going to/from LAN or to/from WAN.

WAN => LAN --> All Frames coming from WAN destined to LAN.

LAN => WAN --> All Frames coming from LAN destined to WAN

User needs to select the interface on which this rule is applied.

Examples:

1.

Global Policy: Forwarded

Protocol Type: PPPoE

Dest. MAC Addr: 00:12:34:56:78:90

Source MAC Addr: NA

Frame Direction: LAN => WAN

WAN Interface Selected: br_0_34/nas_0_34

Addition of this rule drops all PPPoE frames going from LAN-side to WAN-side with a Dest. MAC Addr. of 00:12:34:56:78:90 irrespective of its Source MAC Addr. on the br_0_34 WAN interface. All other frames on this interface are forwarded.

2.

Global Policy: Blocked

Protocol Type: PPPoE

Dest. MAC Addr: 00:12:34:56:78:90

Source MAC Addr: 00:34:12:78:90:56

Frame Direction: WAN => LAN

WAN Interface Selected: br_0_34/nas_0_34

Addition of this rule forwards all PPPoE frames going from WAN-side to LAN-side with a Dest. MAC Addr. of 00:12:34:56:78 and Source MAC Addr. of 00:34:12:78:90:56 on the br_0_34 WAN interface. All other frames on this interface are dropped.

Daytime Parental Control

This feature restricts access of a selected LAN device to an outside Network through the Router, as per chosen days of the week and the chosen times.

User Name: Name of the Filter.

Browser's MAC Address: Displays MAC address of the LAN device on which the browser is running.

Other MAC Address: If restrictions are to be applied to a device other than the one on which the browser is running, the MAC address of that LAN device is entered.

Days of the Week: Days of the week, when the restrictions are applied.

Start Blocking Time: The time when restrictions on the LAN device are put into effect.

End Blocking Time: The time when restrictions on the LAN device are lifted.

Example:

User Name: FilterJohn

Browser's MAC Address: 00:25:46:78:63:21

Days of the Week: Mon, Wed, Fri

Start Blocking Time: 14:00

End Blocking Time: 18:00

When this rule i.e. FilterJohn is entered, a LAN device with MAC Address of 00:25:46:78:63:21 will be restricted access to the outside network on Mondays, Wednesdays and Fridays, from 2pm to 6pm. On all other days and time this device will have access to the outside Network.

Appendix C: Pin Assignments

Line port (RJ11)

Pin	Definition	Pin	Definition
1	-	4	ADSL_TIP
2	-	5	-
3	ADSL_RING	6	-

Pin Assignments of the RJ11 Port

LAN Port (RJ45)

Pin	Definition	Pin	Definition
1	Transmit data+	5	NC
2	Transmit data-	6	Receive data-
3	Receive data+	7	NC
4	NC	8	NC

Pin assignments of the LAN Port

Appendix D: Specifications

Rear Panel

RJ-11 X1 for ADSL2+/VDSL2, RJ-45 X 4 for LAN, Reset Button X 1, USB X 1,
USB host X 1, FXS x 2, FXO x 1

Side Panel

Power Jack X 1

WAN Interface

DSL Standard

ADSL Standard ITU-T G.992.5, ITU-T G.992.3, ITU-T G.992.1, ANSI
T1.413 Issue 2

ADSL2+ Downstream: Up to 24 Mbps Upstream: 1.3 Mbps
VDSL2 Standard ITU-T G.993.2

VDSL2 Downstream: Up to 100 Mbps Upstream: 50 Mbps

LAN Interface

Ethernet x 4

WLAN

Standard IEEE802.11g, backward compatible with 802.11b

Encryption 64, 128-bit Wired Equivalent Privacy (WEP) Data Encryption

Channels 11 Channels (US, Canada)
 13 Channels (Europe)
 14 Channels (Japan)

Data Rate Up to 54Mbps

MAC Address Filtering, WEP, WPA IEEE 802.1X

10, 25, 50 100Mw @ mHz channel bandwidth Output power level can be
selected according to the environment

Analog Interface

FXS x 2, FXO x 1

ATM Attributes

RFC 2364, RFC 2684 (RFC 1483) Bridge; RFC 2684(RFC1483) Route; RFC 2516;
RFC 1577

VCs	8
AAL type	AAL5
ATM service class	UBR/CBR/VBR
ATM UNI support	UNI3.1/4.0
OAM F4/F5	Yes

Management

Telnet, Web-based management, Configuration backup and restoration
Software upgrade via HTTP, TFTP server, or FTP server
Supports TR-069

Bridge Functions

Transparent bridging and learning	IEEE 802.1d
VLAN support	Yes
Spanning Tree Algorithm	Yes
IGMP Proxy	Yes

Routing Functions

Static route, RIP, and RIP v1,v2, NAT/PAT, DHCP Client/Server/ Relay, DNS,
ARP

Security Functions

Authentication protocols PAP, CHAP,
VPN PPTP / L2TP / IPSec pass-through
Stateful Packet Inspection, Packet filtering, Denial Of Service protection, Traffic
Conditioning, WFQ-based Bandwidth Management, HTTP proxy

QoS

L3 policy-based QoS, IP QoS, ToS

Voice Functions

SIP	RFC 3261
MGCP	RFC 3435
Codec	G.711, G.723.1, G.729ab
RTP	RFC 1889
SDP	RFC 2327
Caller ID	ETSI based
Life line / Emergency call	Yes
Echo Cancellation	G.168
Silence suppression	Yes

Power Supply

External power adapter 100 Vac - 240 Vac to 15VDC / 1.5A

Environmental Conditions

Operating temperature 0 ~ 50 degrees Celsius

Relative humidity 5 ~ 90% (non-condensing)

Dimensions

205 mm (W) x 47 mm (H) x 145 mm (D)

Note: Specifications are subject to change without notice.

Appendix E: SSH Client

Linux OS comes with ssh client. MicroSoft Windows does not have ssh client but there is a public domain one "putty" that you can download.

<http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html>

To access the Router using Linux ssh client:

From LAN: Use the Router WEB UI to enable SSH access from LAN.

(default is enabled)

type: `ssh -l admin 192.168.1.1`

From WAN: In the Router, use WEB UI to enable SSH access from WAN.

type: `ssh -l support Router-WAN-ip-address`

To access the Router using Windows putty ssh client:

From LAN: Use the Router WEB UI to enable SSH access from LAN

(default is enabled)

type: `putty -ssh -l admin 192.168.1.1`

From WAN: In the Router, use WEB UI to enable SSH access from WAN.

type: `putty -ssh -l support Router-WAN-ip-address`
